17 This document is an unapproved draft of a proposed IEEE Standard. As such, this document is subject to
18 change. **USE AT YOUR OWN RISK!** Because this is an unapproved draft, this document must not be
19 utilized for any conformance/compliance purposes. Permission is hereby granted for IEEE Standards
20 Committee participants to reproduce this document for purposes of international standardization
21 consideration. Prior to adoption of this document, in whole or in part, by another standards development
22 organization, permission must first be obtained from the IEEE Standards Activities Department
23 (stds.ipr@ieee.org). Other entities seeking permission to reproduce this document, in whole or in part, must
24 also obtain permission from the IEEE Standards Activities Department.

No part of this publication may be reproduced in any form, in an electronic retrieval system or otherwise, without the prior written permission of the publisher.

1 **IEEE Standards** documents are developed within the IEEE Societies and the Standards Coordinating Committees of
2 the IEEE Standards Association (IEEE-SA) Standards Board. The IEEE develops its standards through a consensus
3 development process, approved by the American National Standards Institute, which brings together volunteers
4 representing varied viewpoints and interests to achieve the final product. Volunteers are not necessarily members of the
5 Institute and serve without compensation. While the IEEE administers the process and establishes rules to promote
6 fairness in the consensus development process, the IEEE does not independently evaluate, test, or verify the accuracy
7 of any of the information or the soundness of any judgments contained in its standards.

8 Use of an IEEE Standard is wholly voluntary. The IEEE disclaims liability for any personal injury, property or other
9 damage, of any nature whatsoever, whether special, indirect, consequential, or compensatory, directly or indirectly
10 resulting from the publication, use of, or reliance upon this, or any other IEEE Standard document.

11 The IEEE does not warrant or represent the accuracy or content of the material contained herein, and expressly
12 disclaims any express or implied warranty, including any implied warranty of merchantability or fitness for a specific
13 purpose, or that the use of the material contained herein is free from patent infringement. IEEE Standards documents
14 are supplied “**AS IS.**”

15 The existence of an IEEE Standard does not imply that there are no other ways to produce, test, measure, purchase,
16 market, or provide other goods and services related to the scope of the IEEE Standard. Furthermore, the viewpoint
17 expressed at the time a standard is approved and issued is subject to change brought about through developments in the
18 state of the art and comments received from users of the standard. Every IEEE Standard is subjected to review at least
19 every five years for revision or reaffirmation, or every ten years for stabilization. When a document is more than five
20 years old and has not been reaffirmed, or more than ten years old and has not been stabilized, it is reasonable to
21 conclude that its contents, although still of some value, do not wholly reflect the present state of the art. Users are
22 cautioned to check to determine that they have the latest edition of any IEEE Standard.

23 In publishing and making this document available, the IEEE is not suggesting or rendering professional or other
24 services for, or on behalf of, any person or entity. Nor is the IEEE undertaking to perform any duty owed by any other
25 person or entity to another. Any person utilizing this, and any other IEEE Standards document, should rely upon his or
26 her independent judgment in the exercise of reasonable care in any given circumstances or, as appropriate, seek the
27 advice of a competent professional in determining the appropriateness of a given IEEE standard.

28 Interpretations: Occasionally questions may arise regarding the meaning of portions of standards as they relate to
29 specific applications. When the need for interpretations is brought to the attention of IEEE, the Institute will initiate
30 action to prepare appropriate responses. Since IEEE Standards represent a consensus of concerned interests, it is
31 important to ensure that any interpretation has also received the concurrence of a balance of interests. For this reason,
32 IEEE and the members of its societies and Standards Coordinating Committees are not able to provide an instant
33 response to interpretation requests except in those cases where the matter has previously received formal consideration.
34 A statement, written or oral, that is not processed in accordance with the IEEE-SA Standards Board Operations Manual
35 shall not be considered the official position of IEEE or any of its committees and shall not be considered to be, nor be
36 relied upon as, a formal interpretation of the IEEE. At lectures, symposia, seminars, or educational courses, an
37 individual presenting information on IEEE standards shall make it clear that his or her views should be considered the
38 personal views of that individual rather than the formal position, explanation, or interpretation of the IEEE.

39 Comments for revision of IEEE Standards are welcome from any interested party, regardless of membership affiliation
40 with IEEE. Suggestions for changes in documents should be in the form of a proposed change of text, together with
41 appropriate supporting comments. Recommendations to change the status of a stabilized standard should include a
42 rationale as to why a revision or withdrawal is required. Comments and recommendations on standards, and requests
43 for interpretations should be addressed to:

44 Secretary, IEEE-SA Standards Board
45 445 Hoes Lane
46 Piscataway, NJ 08854
47 USA

48 Authorization to photocopy portions of any individual standard for internal or personal use is granted by The Institute
49 of Electrical and Electronics Engineers, Inc., provided that the appropriate fee is paid to Copyright Clearance Center.
50 To arrange for payment of licensing fee, please contact Copyright Clearance Center, Customer Service, 222 Rosewood
51 Drive, Danvers, MA 01923 USA; +1 978 750 8400. Permission to photocopy portions of any individual standard for
52 educational classroom use can also be obtained through the Copyright Clearance Center.

1 Introduction

2 This introduction is not part of IEEE P1904.2/D0.1

3 This standard TBD ...

4 Notice to users

5 Laws and regulations

6 Users of IEEE Standards documents should consult all applicable laws and regulations. Compliance with
7 the provisions of any IEEE Standards document does not imply compliance to any applicable regulatory
8 requirements. Implementers of the standard are responsible for observing or referring to the applicable
9 regulatory requirements. IEEE does not, by the publication of its standards, intend to urge action that is not
10 in compliance with applicable laws, and these documents may not be construed as doing so.

11 Copyrights

12 This document is copyrighted by the IEEE. It is made available for a wide variety of both public and
13 private uses. These include both use, by reference, in laws and regulations, and use in private self-
14 regulation, standardization, and the promotion of engineering practices and methods. By making this
15 document available for use and adoption by public authorities and private users, the IEEE does not waive
16 any rights in copyright to this document.

17 Updating of IEEE documents

18 Users of IEEE Standards documents should be aware that these documents may be superseded at any time
19 by the issuance of new editions or may be amended from time to time through the issuance of amendments,
20 corrigenda, or errata. An official IEEE document at any point in time consists of the current edition of the
21 document together with any amendments, corrigenda, or errata then in effect. In order to determine whether
22 a given document is the current edition and whether it has been amended through the issuance of
23 amendments, corrigenda, or errata, visit the IEEE-SA Website at <http://standards.ieee.org/index.html> or
24 contact the IEEE at the address listed previously. For more information about the IEEE Standards
25 Association or the IEEE standards development process, visit the IEEE-SA Website at
26 <http://standards.ieee.org/index.html>.

27 Errata

28 Errata, if any, for this and all other standards can be accessed at the following URL:
29 <http://standards.ieee.org/findstds/errata/index.html>. Users are encouraged to check this URL for errata
30 periodically.

31 Interpretations

32 Current interpretations can be accessed at the following URL:
33 <http://standards.ieee.org/findstds/interps/index.html>.

1 **Patents**

2 Attention is called to the possibility that implementation of this standard may require use of subject matter
3 covered by patent rights. By publication of this standard, no position is taken by the IEEE with respect to
4 the existence or validity of any patent rights in connection therewith. If a patent holder or patent applicant
5 has filed a statement of assurance via an Accepted Letter of Assurance, then the statement is listed on the
6 IEEE-SA website <http://standards.ieee.org/about/sasb/patcom/patents.html>. Letters of Assurance may
7 indicate whether the Submitter is willing or unwilling to grant licenses under patent rights without
8 compensation or under reasonable rates, with reasonable terms and conditions that are demonstrably free of
9 any unfair discrimination to applicants desiring to obtain such licenses.

10 Essential Patent Claims may exist for which a Letter of Assurance has not been received. The IEEE is not
11 responsible for identifying Essential Patent Claims for which a license may be required, for conducting
12 inquiries into the legal validity or scope of Patents Claims, or determining whether any licensing terms or
13 conditions provided in connection with submission of a Letter of Assurance, if any, or in any licensing
14 agreements are reasonable or nondiscriminatory. Users of this standard are expressly advised that
15 determination of the validity of any patent rights, and the risk of infringement of such rights, is entirely
16 their own responsibility. Further information may be obtained from the IEEE Standards Association.

17

1 Participants

2 At the time this draft standard was submitted to the IEEE-SA Standards Board for approval, the following
3 is a place holder:

4  , *Working Group Chair*
5  , *Editor*
6 

7
8
9 The following individuals submitted technical contributions or commented on the draft standard at various
10 stages of the project development.

11
12
13 Name 14

15
16 The following members of the <individual/entity> balloting committee voted on this standard. Balloters
17 may have voted for approval, disapproval, or abstention.

18
19 *(to be supplied by IEEE)*

20
21 Balloter1 24 Balloter4 27 Balloter7
22 Balloter2 25 Balloter5 28 Balloter8
23 Balloter3 26 Balloter6 29 Balloter9

30
31
32 When the IEEE-SA Standards Board approved this standard on <XX MONTH 20XX>, it had the following
33 membership:

34 *(to be supplied by IEEE)*

35 <Name>, *Chair*
36 <Name>, *Vice Chair*
37 <Name>, *Past President*
38 <Name>, *Secretary*

2 **1.1 Scope**

3 This standard TBD ...

4 **1.2 Purpose**

5 The purpose of this standard is to TBD ...

6 **1.3 Coverage**

7 This specification provides TBD ...

8 **1.4 Overview of clauses**

9 This subclause provides an overview of the scope of individual clauses included in this specification,
10 namely:

11 — TBD ...

1 **2 Normative references**

2 The following referenced documents are indispensable for the application of this document (i.e., they must
3 be understood and used, so each referenced document is cited in text and its relationship to this document is
4 explained). For dated references, only the edition cited applies. For undated references, the latest edition of
5 the referenced document (including any amendments or corrigenda) applies.

6

1 **3 Definitions, acronyms, and abbreviations**

2 **3.1 Definitions**

3 For the purposes of this document, the following terms and definitions apply. The IEEE Standards
4 Dictionary Online should be consulted for terms not defined in this clause.¹

5 TBD

6 **3.2 Acronyms and abbreviations**

7 UMT - Universal Management Tunnel

8 UMTDP - Universal Management Tunnel Discovery Protocol

9 **3.3 Special Terms**

10 **Term:** Definition

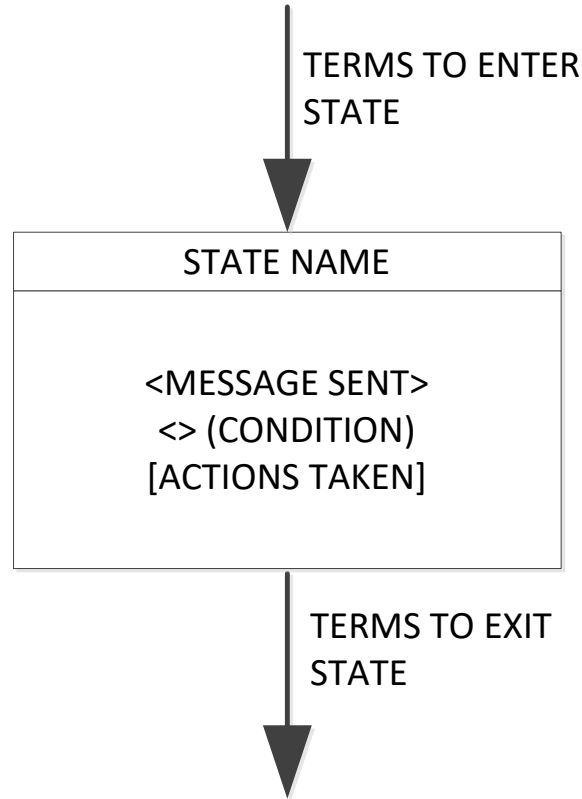

11 **3.4 Notation for state diagrams**

12 All the state diagrams used in this standard meet the set of requirements included in the following
13 subclauses.

14 **3.4.1 General conventions**

15 The operation of any protocol defined in this standard can be described by subdividing the protocol into a
16 number of interrelated functions. The operation of the functions can be described by state diagrams. Each
17 diagram represents the domain of a function and consists of a group of connected, mutually exclusive states.
18 Only one state of a function is active at any given time (see Figure 3-1).

¹ IEEE Standards Dictionary Online subscription is available at
http://www.ieee.org/portal/innovate/products/standard/standards_dictionary.html.

1

2

Figure 3-1—State diagram notation example

3.4.1.1 Representation of states

Each state that the function can assume is represented by a rectangle. These are divided into two parts by a horizontal line. In the upper part the state is identified by a name in capital letters. The lower part contains the body of the given state, containing description of the actions taken in this state, as defined in 3.4.3.

3.4.1.2 Transitions

All permissible transitions between the states of a function are represented graphically by arrows between them. A transition that is global in nature (for example, an exit condition from all states to the IDLE or RESET state) is indicated by an open arrow (an arrow with no source block). Global transitions are evaluated continuously whenever any state is evaluating its exit conditions. When the condition for a global transition becomes true, it supersedes all other transitions, including Unconditional Transition (UCT), returning control to the block pointed to by the open arrow.

Labels on transitions are qualifiers that are required to be fulfilled before the transition is taken. The label UCT designates an unconditional transition. Qualifiers described by short phrases are enclosed in parentheses.

The following terms are valid transition qualifiers:

- Boolean expressions
- An event such as the expiration of a timer: timer_done
- An event such as the reception of a message: MAC_DATA.indication

1 — An unconditional transition: UCT

2 — A branch taken when other exit conditions are not satisfied: ELSE

3 State transitions occur instantaneously. No transition in the state diagram can cross another transition.
4 When possible, any two transitions with different logical conditions are not joined together into a single
5 transition line.

6 **3.4.2 State diagrams and accompanying text**

7 State diagrams take precedence over text.

8 **3.4.3 Actions inside state blocks**

9 The actions inside a state block execute instantaneously. Actions inside state blocks are atomic (i.e.,
10 uninterruptible).

11 After performing all the actions listed in a state block one time, the state diagram then continuously
12 evaluates exit conditions for the given state block until one is satisfied, at which point control passes
13 through a transition arrow to the next block. While the state awaits fulfillment of one of its exit conditions,
14 the actions inside do not implicitly repeat.

15 Valid state actions may include generation of *indication* and *request* primitives.

16 No actions are taken outside of any blocks of the state diagram.

17 **3.4.4 State diagram variables**

18 Once set, variables retain their values as long as succeeding blocks contain no references to them.

19 Setting the parameter of a formal interface message assures that, on the next transmission of that message,
20 the last parameter value set is transmitted.

21 Testing the parameter of a formal interface message tests the value of that message parameter that was
22 received on the last transmission of said message. Message parameters may be assigned default values that
23 persist until the first reception of the relevant message.

24 **3.4.5 Operators**

25 The state diagram operators are shown in Table 3-1.

26 **Table 3-1—State diagram operators**

Character	Meaning
AND	Boolean AND
OR	Boolean OR
XOR	Boolean XOR
!	Boolean NOT
<	Less than
>	More than
≤	Less than or equal to
≥	More than or equal to
==	Equals (a test of equality)
!=	Not equals
()	Indicates precedence

Character	Meaning
=	Assignment operator
	Concatenation operation that combines several sub-fields or parameters into a single aggregated field or parameter
else	No other state condition is satisfied
true	Designation of a Boolean value of TRUE
false	Designation of a Boolean value of FALSE

1 3.4.6 Timers

2 Some of the state diagrams use timers for various purposes, e.g., measurement of time, and confirmation of
3 activity. All timers operate in the same fashion.

4 A timer is reset and starts counting upon entering a state where [start x_timer, x_timer_value] is asserted.
5 Time “x” after the timer has been started, “x_timer_done” is asserted and remains asserted until the timer is
6 reset. At all other times, “x_timer_not_done” is asserted.

7 When entering a state where [start x_timer, x_timer_value] is asserted, the timer is reset and restarted even
8 if the entered state is the same as the exited state.

9 Any timer can be stopped at any time upon entering a state where [stop x_timer] is asserted, which aborts
10 the operation of the “x_timer” asserting “x_timer_not_done” indication until the timer is restarted again.

11 3.4.7 Hexadecimal notation

12 Numerical values designated by the 0x prefix indicate a hexadecimal notation of the corresponding number,
13 with the least significant bit shown on the right. For example: 0x0F represents an 8-bit hexadecimal value
14 of the decimal number 15; 0x00-00-00-00 represents a 32-bit hexadecimal value of the decimal number 0;
15 0x11-AB-11-AB represents a 32-bit hexadecimal value of the decimal number 296423851.

16 3.4.8 Binary notation

17 Numerical values designated by the 0b prefix indicate a binary notation of the corresponding number, with
18 the least significant bit shown on the right. For example: 0b0001000 represents an 8-bit binary value of the
19 decimal number 8.

20 3.5 Notation for PICS

21 The supplier of a device implementation that is claimed to conform to this standard is required to complete
22 a protocol implementation conformance statement (PICS) proforma.

23 A completed PICS proforma is the PICS for the implementation in question. The PICS is a statement of
24 which capabilities and options of this standard have been implemented. The PICS can be used for a variety
25 of purposes by various parties, including the following:

- 26 a) As a checklist by the protocol implementer, to reduce the risk of failure to conform to the standard
27 through oversight;
- 28 b) As a detailed indication of the capabilities of the implementation, stated relative to the common
29 basis for understanding provided by the standard PICS proforma, by the supplier and acquirer, or
30 potential acquirer, of the implementation;
- 31 c) As a basis for initially checking the possibility of interworking with another implementation by
32 the user, or potential user, of the implementation (note that, while interworking can never be
33 guaranteed, failure to interwork can often be predicted from incompatible PICS);

- 1 d) As the basis for selecting appropriate tests against which to assess the claim for conformance of
2 the implementation, by a protocol tester.

3 Each PICS entry is uniquely identified by an item number, with the following form: [Package][Device]-
4 [Feature][Number], where:

- 5 — [Package] is the designation of the given Package,
- 6 — [Device] identifies whether the given PICS item describes the ONU (U) or OLT (T) requirements,
- 7 — [Feature] is the identification of individual features, and finally,
- 8 — [Number] is a number allocated to each subsequent PICS entry. This item may have one of two
9 possible formats: a decimal number or a decimal number followed by a lower-case letter. The first
10 format is used to designate PICS with functionally distinct requirements. The latter format is used
11 to designate PICS with functionally similar requirements.

12 For example, CU-LPTK3a represents a PICS entry for an ONU compliant with Package C for the “optical
13 link protection, trunk type” feature, item 3, subitem a.

14 3.5.1 Abbreviations and special symbols

15 The following symbols are used in the PICS proforma:

M	mandatory field/function
!	negation
O	optional field/function
O.<n>	optional field/function, but at least one of the group of options labeled by the same numeral <n> is required
O/<n>	optional field/function, but one and only one of the group of options labeled by the same numeral <n> is required
X	prohibited field/function
<item>:	simple-predicate condition, dependent on the support marked for <item>
<item1>*<item2>:	AND-predicate condition, the requirement needs to be met if both optional items are implemented

16 3.5.2 Instructions for completing the PICS proforma

17 The first part of the PICS proforma, Implementation Identification and Protocol Summary, is to be
18 completed as indicated with the information necessary to identify fully both the supplier and the
19 implementation.

20 The main part of the PICS proforma is a fixed-format questionnaire divided into subclauses, each
21 containing a group of items. Answers to the questionnaire items are to be provided in the right-most
22 column, either by simply marking an answer to indicate a restricted choice (usually Yes, No, or Not
23 Applicable), or by entering a value or a set or range of values. (Note that there are some items where two or
24 more choices from a set of possible answers can apply; all relevant choices are to be marked.)

25 Each item is identified by an item reference in the first column; the second column contains the question to
26 be answered; the third column contains the reference or references to the material that specifies the item in
27 the main body of the standard; the fourth column contains values and/or comments pertaining to the
28 question to be answered. The remaining columns record the status of the items—whether the support is
29 mandatory, optional or conditional—and provide the space for the answers.

30 The supplier may also provide, or be required to provide, further information, categorized as either
31 Additional Information or Exception Information. When present, each kind of further information is to be

1 provided in a further subclause of items labeled A<i> or X<i>, respectively, for cross-referencing purposes,
2 where <i> is any unambiguous identification for the item (e.g., simply a numeral); there are no other
3 restrictions on its format or presentation.

4 A completed PICS proforma, including any Additional Information and Exception Information, is the
5 protocol implementation conformance statement for the implementation in question.

6 Note that where an implementation is capable of being configured in more than one way, according to the
7 items listed under Major Capabilities/Options, single PICS may be able to describe all such configurations.
8 However, the supplier has the choice of providing more than one PICS, each covering some subset of the
9 implementation's configuration capabilities, if that would make presentation of the information easier and
10 clearer.

11 **3.5.3 Additional information**

12 Items of Additional Information allow a supplier to provide further information intended to assist the
13 interpretation of the PICS. It is not intended or expected that a large quantity be supplied, and the PICS can
14 be considered complete without any such information. Examples might be an outline of the ways in which
15 a (single) implementation can be set up to operate in a variety of environments and configurations; or a
16 brief rationale, based perhaps upon specific application needs, for the exclusion of features that, although
17 optional, are nonetheless commonly present in implementations.

18 References to items of Additional Information may be entered next to any answer in the questionnaire, and
19 may be included in items of Exception Information.

20 **3.5.4 Exception information**

21 It may occasionally happen that a supplier wishes to answer an item with mandatory or prohibited status
22 (after any conditions have been applied) in a way that conflicts with the indicated requirement. No pre-
23 printed answer is found in the Support column for this; instead, the supplier is required to write into the
24 Support column an X<i> reference to an item of Exception Information, and to provide the appropriate
25 rationale in the Exception item itself.

26 An implementation for which an Exception item is required in this way does not conform to this standard.
27 Note that a possible reason for the situation described above is that a defect in the standard has been
28 reported, a correction for which is expected to change the requirement not met by the implementation.

29 **3.5.5 Conditional items**

30 The PICS proforma may contain conditional items. These are items for which both the applicability of the
31 item itself, and its status if it does apply—mandatory, optional, or prohibited—are dependent upon whether
32 or not certain other items are supported.

33 Individual conditional items are indicated by a conditional symbol of the form “<item>:<s>” in the Status
34 column, where “<item>” is an item reference that appears in the first column of the table for some other
35 item, and “<s>” is a status symbol, M (Mandatory), O (Optional), or X (Not Applicable).

36 If the item referred to by the conditional symbol is marked as supported, then:

- 37 a) the conditional item is applicable,
- 38 b) its status is given by “<s>”, and
- 39 c) the support column is to be completed in the usual way.

- 1 Each item whose reference is used in a conditional symbol is indicated by an asterisk in the Item column.

1 **4 Universal Management Tunnel (UMT)**

2 Editorial Note: this Clause will describe the UMT architecture, showing a single UMT domain
3 interconnecting multiple L2 domains with UMT switches, and showing UMT instance between two UMT
4 end-points. Description of the individual device functions follows (tentative names are used)

5 **4.1 Overview**

6 **4.1.1 Scope**

7 This clause defines the Universal Management Tunnel (UMT) which is intended to be a supplemental layer
8 in the IEEE 802 architecture. The UMT provides a mechanism for transmitting service data units for higher
9 layer protocols across a layer-2 network in which those protocols would not normally be forwarded due to
10 addressing conflicts or other factors.

11 UMT data from user entities is conveyed in frames called UMT Protocol Data Units (UMTPDUs).
12 UMTPDUs contain the appropriate information to identify the encapsulated protocol for delivery to the
13 correct receiving entity. UMTPDUs traverse one or more links and are passed between peer UMT entities,
14 therefore UMTPDUs are forwarded by MAC clients (e.g. bridges or switches).

15

16 ~~This standard will describe a management channel for customer-premises equipment (CPE) connected to~~
17 ~~Ethernet based subscriber access networks. The key characteristics of the specified management channel~~
18 ~~are:~~

19

20 ~~Multi hop capabilities to allow management of various CPE devices located behind an Optical Network~~
21 ~~Unit (ONU), a Coaxial Network Unit (CNU), a Residential Gateway (RGW), etc.~~

22 ~~Extensibility to accommodate new management protocols and/or new types of CPE devices.~~

23 ~~Broadcast/multicast capabilities to allow simultaneous (synchronized) configuration of multiple devices.~~

24 ~~Encryption capabilities to ensure secure access to managed CPE devices by the network operators.~~

25 ~~The standard will describe the message format as well as processing operations and forwarding rules at the~~
26 ~~intermediate nodes.~~

27

28

29 **4.1.2 Summary of objectives and major concepts**

30 This subclause provides details and functional requirements for the UMT objectives:

31 a) Bridge/Switch traversal: A mechanism is defined to forward UMTPDUs across bridges and
32 switches.

33 b) Allow a single UMT User entity to send messages to one or more peer entities simultaneously
34 using multicast or broadcast messages.

- 1 c) Allow the protocol to be extended to accommodate new user protocols to be supported in the
2 future.

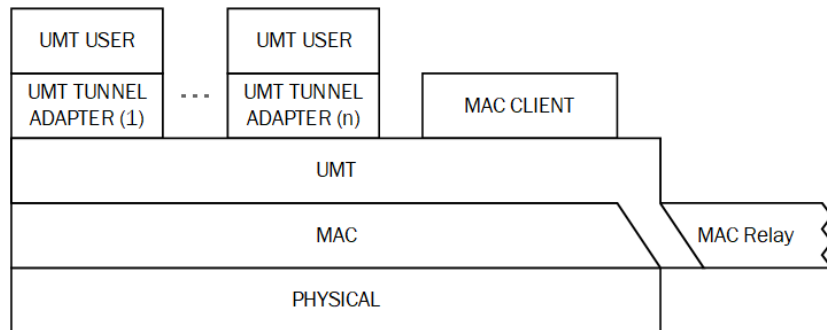

3 4.1.3 Summary of non-objectives

4 This subclause explicitly lists certain functions that are not addressed by UMT. These functions, while
5 valuable, do not fall within the scope of this standard.

- 6 a) Tunnel state/status: This standard does not define a tunnel state or status maintenance method.
7 UMT is a stateless protocol.
- 8 b) UMT Peer discovery: Discovery of UMT peers in the UMT network is out of scope of this
9 standard. This standard does not define a UMT-specific method to discover or detect UMT peers.
- 10 c) Router traversal: Router traversal is out of scope of this standard. This standard does not define
11 methods to forward UMTPDUs across Network-Layer clients (e.g. IP routers, IP hosts).

12 4.1.4 Positioning of UMT in the IEEE 802 Architecture

13 UMT comprises an optional sublayer between a superior sublayer (e.g., MAC Client) and a subordinate
14 sublayer (e.g., MAC or optional MAC Control sublayer). UMT is also composed of a shim between the
15 MAC and MAC Relay entities. Figure 4-1 shows the architectural relationship of the UMT layer to the
16 MAC, MAC Clients and UMT Users.

17
18 **Figure 4-1 - UMT relationship to the IEEE 802 model**

19 20 4.1.5 Compatibility Considerations

21 4.1.5.1 Application

22 UMT is intended for use in IEEE 802 networks. Nothing in this standard disallows implementation of UMT
23 on non-IEEE 802 networks, but description of such implementation is out of the scope of this standard.

24 A conformant implementation may implement the UMT sublayer for some ports within a system while not
25 implementing it for other ports on the same system.

26 4.1.5.2 Interoperability between UMT capable DTEs

27 A DTE is able to determine whether or not a remote DTE has UMT functionality enabled. The optional
28 UMT Discovery mechanism described in the annex discovers the presence of UMT peers and their
29 configured parameters, such as maximum allowable UMTPDU size, and supported UMT User protocols.

1 **4.1.5.3 Interface to MAC Clients**

2 The UMT Sublayer described in this standard implements a transparent pass-through for MAC clients that
 3 generate the MA_DATA.request service primitive (and expect the MA_DATA.indication service
 4 primitive). In some cases, such as OAM described in IEEE Std. 802.3 Clause 57, a protocol might be
 5 required to operate as a MAC client and as a UMT User.

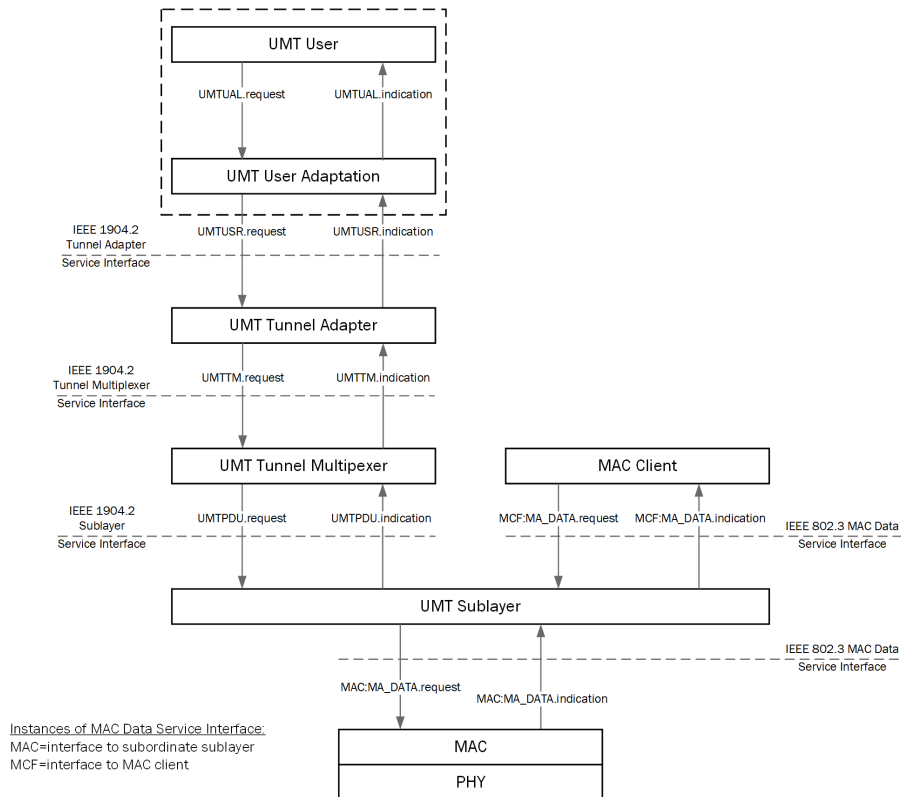

6 This standard may describe in text or depict in figures such protocols as having multiple instances – one at
 7 the native position in the protocol stack and another at the UMT User position in the protocol stack. This
 8 depiction is intended only to clarify the intended operation of the protocol with respect to UMT and not to
 9 specify the method of implementation.

10 Similarly, it is out of the scope of this standard to describe the position and operation of all possible MAC
 11 clients and MAC functions (such as MAC Control) relative to UMT. Where this standard is silent on the
 12 operation of a protocol relative to UMT’s transparent pass-through functionality for MAC clients, that
 13 protocol shall conform to its specification and operate as if UMT were not present.

14 **4.2 Functional Specifications**

15 **4.2.1 Interlayer Service Interfaces**

16 Figure 4-2 depicts the usage of interlayer interfaces by the UMT layer.

17

18 **Figure 4-2 - UMT interlayer service interfaces**

19 **4.2.2 Principles of Operation**

20 UMT employs the following principles and concepts:

- 1 a) UMTPDUs traverse a single bridging domain and are passed between UMT Sublayer entities.
 2 UMTPDUs are forwarded by intermediate bridges according to IEEE Std. 802.1Q and IEEE Std.
 3 802.1D.
- 4 b) UMT is a stateless/connectionless transmission method.
- 5 c) The UMT Sublayer presents a standard IEEE 802.3 MAC service interface to the superior
 6 sublayer, which is the MAC Client.
- 7 d) The UMT Sublayer employs a standard IEEE 802.3 MAC service interface to the subordinate
 8 sublayer. Subordinate sublayers include MAC and MAC Control.
- 9 e) Frames from superior sublayers are multiplexed within the UMT Sublayer with UMTPDUs.
- 10 f) The UMT Sublayer parses received frames and passes UMTPDUs to the UMT Tunnel Multiplexer.
 11 Non-UMTPDUs are passed to the superior sublayer.
- 12 g) Knowledge of the underlying Physical Layer device is not required by the UMT Sublayer.
- 13 h) The UMT Tunnel Multiplexer parses received UMTPDUs and passes them to an appropriate UMT
 14 Tunnel Adapter based on tunnel identifying fields, the source MAC address and destination MAC
 15 address.
- 16 i) The UMT Tunnel Adapter in UMT unicast operation emulates a point-to-point link to the remote
 17 UMT peer.
- 18 j) The UMT Tunnel Adapter parses received UMTPDUs and passes the UMT user service data to
 19 the appropriate UMT User.
- 20 k) The optional UMT User Adaptation layer is an abstract layer that adapts the UMT User service
 21 interface to the UMT Tunnel Adapter service interface.
- 22 l) The UMT User can be any protocol layer that could normally exist above MAC Control.

23 4.2.3 Instances of the MAC data service interface

24 A superior sublayer such as the MAC client communicates with the UMT Sublayer using the standard
 25 MAC data service interface specified in IEEE Std. 802.3 Clause 2. Similarly, the UMT Sublayer
 26 communicates with a subordinate sublayer such as the MAC Control or MAC using the same standard
 27 service interfaces.

28 This clause uses two instances of the MAC data service interface, therefore it is necessary to introduce a
 29 notation convention so that the reader can be clear as to which interface is being referred to at any given
 30 time. A prefix is therefore assigned to each service primitive, indicating which of the two interfaces is
 31 being invoked, as depicted in Figure 4-2. The prefixes are as follows:

- 32 a) MCF:, for primitives issued on the interface between the superior sublayer and the UMT Sublayer
 33 (MCF is an abbreviation for MAC client frame)
- 34 b) MAC:, for primitives issued on the interface between the underlying subordinate sublayer (e.g.,
 35 MAC) and the UMT Sublayer

36 4.2.4 UMT User

37 The UMT User is the functional block that uses the UMT to forward data across the UMT network.

1 **4.2.4.1 Responsibilities of the UMT User**

2 The UMT User makes requests to the UMT User Adaption layer to send data across the UMT. The UMT
3 User also listens to the UMT User Adaptation Layer for incoming data. Generally, interactions with the
4 peer UMT User is out of the scope of this standard. Informative annexes have been included to guide
5 implementors in the use of UMT. In some cases, the annex has been made normative.

6 **4.2.4.2 UMT User Interactions**

7 The UMT User entity communicates with the UMT User Adaptation using the following interlayer service
8 interfaces:

9 UMTUAL.request

10 UMTUAL.indication

11 The UMTUAL.request and UMTUAL.indication, service primitives described in this subclause are
12 mandatory.

13 **4.2.4.2.1 UMTUAL.request**

14 **4.2.4.2.1.1 Function**

15 This primitive defines the transfer of data from an UMT User entity to the UMT User Adaptation entity.
16 This primitive is specific to the UMT User protocol and is implementation specific. Informative annexes
17 have been included to guide implementors. In some cases, the annex has been made normative.

18 **4.2.4.2.1.2 Semantics of the service primitive**

19 The semantics of the primitive are implementation specific.

20 **4.2.4.2.1.3 When Generated**

21 This primitive is generated by the UMT User entity whenever a user PDU is to be transferred to a peer
22 entity.

23 **4.2.4.2.1.4 Effect of Receipt**

24 The receipt of this primitive will cause the UMT User Adaptation entity to perform any required parsing
25 and transformations of the received parameters necessary to send the UMT User PDU over the UMT. After
26 performing these actions, the UMT User Adaptation entity asserts the UMTUSR.request primitive to the
27 UMT Tunnel Adapter according to the procedures described in 4.2.5.2.1.

28 **4.2.4.2.2 UMTUAL.indication**

29 **4.2.4.2.2.1 Function**

30 This primitive defines the transfer of data from a UMT User Adaptation entity to a UMT User entity. This
31 primitive is specific to the UMT User protocol and is implementation specific. Informative annexes have
32 been included to guide implementors. In some cases, the annex has been made normative.

33 **4.2.4.2.2.2 Semantics of the service primitive**

34 The semantics of the primitive are implementation specific.

1 **4.2.4.2.3 When Generated**

2 This primitive is passed from the UMT User Adaptation entity to the UMT User entity to indicate the
3 arrival of a UMTPDU to the local UMT User. Such UMTPDUs are reported only if they are validly formed
4 and received without error.

5 **4.2.4.2.4 Effect of Receipt**

6 The effect of receipt of this primitive by the UMT User is unspecified.

7 **4.2.5 UMT User Adaptation**

8 **4.2.5.1 Responsibilities of the UMT User Adaptation**

9 The UMT User Adaptation is an intermediate layer that adapts the UMT User interfaces to the UMT
10 Tunnel Adapter interfaces. The UMT User Adaptation receives transmit requests from the UMT User via
11 the UMTUAL.request primitive, transforms those requests as needed, and passes the results into the UMT
12 Tunnel Adapter via the UMTUSR.request primitive. In similar fashion, the UMT User Adaptation receives
13 incoming data via the UMTUSR.indication primitive, transforms those requests as needed, and passes the
14 results into the UMT User via the UMTUAL.indication primitive.

15 The required transformations are specific to the UMT User entity and are left unspecified. Example UMT
16 User Adaptations are provided in the Annex.

17 **4.2.5.2 UMT User Adaptation Interactions**

18 The UMT User Adaptation entity communicates with the UMT Tunnel Adapter using the following
19 interlayer service interfaces:

20 UMTUSR.request

21 UMTUSR.indication

22 The UMTUSR.request and UMTUSR.indication, service primitives described in this subclause are
23 mandatory.

24 **4.2.5.2.1 UMTUSR.request**

25 **4.2.5.2.1.1 Function**

26 This primitive defines the transfer of data from an UMT User Adaptation entity to a UMT Tunnel Adapter
27 entity.

28 **4.2.5.2.1.2 Semantics of the service primitive**

29 The semantics of the primitive are as follows:

30 UMTUSR.request (

31 umt_subtype,

32 umt_user_sdu

33)

1 The `umt_subtype` is used to identify the intended UMT User entity and is used to populate the Subtype field
 2 of the UMTPDU. The `umt_user_sdu` parameter is used to create the Data field within the UMTPDU to be
 3 transmitted.

4 **4.2.5.2.1.3 When generated**

5 This primitive is generated by the UMT User Adaptation entity whenever a user PDU is to be transferred to
 6 a peer entity using UMT.

7 **4.2.5.2.1.4 Effect of Receipt**

8 The receipt of this primitive will cause the UMT Tunnel Adapter entity to multiplex the request with
 9 requests from other UMT User entities and assert the UMTTM.request primitive to the UMT Tunnel
 10 Multiplexer according to the procedures described in 4.2.7.3.1.

11 **4.2.5.2.2 UMTUSR.indication**

12 **4.2.5.2.2.1 Function**

13 This primitive defines the transfer of data from an UMT Tunnel Adapter entity to an UMT User Adaptation
 14 Layer entity.

15 **4.2.5.2.2.2 Semantics of the service primitive**

16 The semantics of the primitive are as follows:

```
17 UMTUSR.indication (
18     destination_address,
19     source_address,
20     umt_subtype,
21     umt_user_sdu
22 )
```

23 The value of the `destination_address` parameter is copied from the `destination_address` parameter received
 24 in the UMTTM.indication primitive. The value of the `source_address` parameter is copied from the
 25 `source_address` parameter received in the UMTTM.indication primitive. The value of the `umt_user_sdu`
 26 parameter is copied from the `umt_user_sdu` parameter received in the UMTPDU.indication primitive.

27 **4.2.5.2.2.3 When generated**

28 This primitive is passed from the UMT Tunnel Adapter entity to the UMT User Adaptation entity to
 29 indicate the arrival of a UMTPDU to the local UMT User. Such UMTPDUs are reported only if they are
 30 validly formed and received without error.

31 **4.2.5.2.2.4 Effect of Receipt**

32 The receipt of this primitive will cause the UMT User Adaptation entity to perform any required parsing
 33 and transformations. After performing these actions, the UMT User Adaptation entity asserts the
 34 UMTUAL.indication primitive to the UMT User Adaptation entity according to the procedures described
 35 in 4.2.4.2.2.

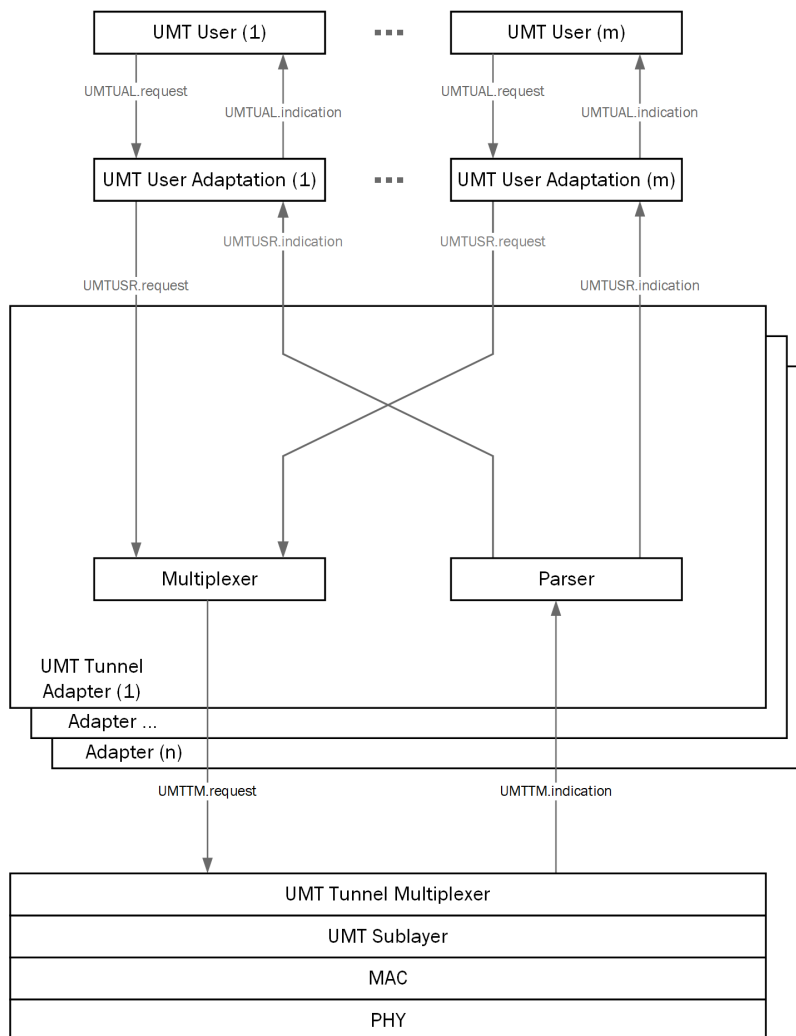

1 **4.2.6 UMT Tunnel Adapter**

2 **4.2.6.1 Responsibilities of the UMT Tunnel Adapter**

3 The UMT Tunnel Adapter multiplexes requests from multiple UMT Users and passes them to the UMT
 4 Tunnel Multiplexer by asserting the UMTTM.request primitive. Similarly, the UMT Tunnel Adapter layer
 5 receives UMTPDUs from the UMT Tunnel Multiplexer via the UMTTM.indication primitive and parses
 6 the UMTPDUs for delivery to the UMT User designated by the Subtype field. Delivery to the UMT Tunnel
 7 User Adaptation entity occurs via assertion of the UMTUSR.indication primitive.

8 **4.2.6.2 Block Diagram**

9 Figure 4-3 depicts the major blocks within the UMT Tunnel Adapter and their interrelationships with one
 10 another and external entities.

11

12

Figure 4-3 - UMT Tunnel Adapter Block Diagram

1 **4.2.6.3 UMT Tunnel Adapter Interactions**

2 The UMT Tunnel Adapter entity communicates with the UMT Tunnel Multiplexer using the following
3 interlayer service interfaces:

4 UMTTM.request

5 UMTTM.indication

6 The UMTTM.request and UMTTM.indication service primitives described in this subclause are mandatory.

7 **4.2.6.3.1 UMTTM.request**

8 **4.2.6.3.1.1 Function**

9 This primitive defines the transfer of data from an UMT Tunnel Adapter entity to the UMT Tunnel
10 Multiplexer entity.

11 **4.2.6.3.1.2 Semantics of the service primitive**

12 The semantics of the primitive are as follows:

13 UMTTM.request (

14 umt_tunnel_id

15 umt_subtype,

16 umt_user_sdu

17)

18 The umt_tunnel_id parameter identifies the specific UMT Tunnel Adapter instance asserting the service
19 primitive and is used by the UMT Tunnel Multiplexer to assign the source MAC address and destination
20 MAC address. The umt_user_data parameter is used to create the Data field within the UMTPDU to be
21 transmitted. The umt_subtype and umt_user_sdu are copied from the UMTUSR.request primitive.

22 **4.2.6.3.1.3 When Generated**

23 This primitive is generated by the UMT Tunnel Adapter entity whenever an UMTPDU is to be transferred
24 to a peer entity.

25 **4.2.6.3.1.4 Effect of Receipt**

26 The receipt of this primitive will cause the UMT Tunnel Multiplexer entity to multiplex the request with
27 requests from other UMT Tunnel Adapter entities and assert the UMTPDU.request primitive to the UMT
28 Sublayer according to the procedures described in 4.2.7.3.1.

29 **4.2.6.3.2 UMTTM.indication**

30 **4.2.6.3.2.1 Function**

31 This primitive defines the transfer of data from the UMT Tunnel Multiplexer entity to a single instance of a
32 UMT Tunnel Adapter entity.

1 **4.2.6.3.2.2 Semantics of the service primitive**

```

2 UMTTM.indication (
3     umt_tunnel_id,
4     destination_address,
5     source_address,
6     umt_subtype,
7     umt_user_sdu
8 )

```

9 The `umt_tunnel_id` parameter identifies the specific UMT Tunnel Adapter instance to which the service
10 primitive is being addressed. The value of the `destination_address` parameter is copied from the
11 `destination_address` parameter received in the `UMTPDU.indication` primitive. The value of the
12 `source_address` parameter is copied from the `source_address` parameter received in the
13 `UMTPDU.indication` primitive. The value of the `umt_user_sdu` parameter is copied from the `umt_user_sdu`
14 parameter received in the `UMTPDU.indication` primitive.

15 **4.2.6.3.2.3 When Generated**

16 This primitive is passed from the UMT Tunnel Multiplexer entity to a single instance of a UMT Tunnel
17 Adapter entity to indicate the arrival of a `UMTPDU` to a local UMT User. Such `UMTPDU`s are reported
18 only if they are validly formed and received without error.

19 **4.2.6.3.2.4 Effect of Receipt**

20 The receipt of this primitive by a UMT Tunnel Adapter will cause the UMT Tunnel Adapter parser
21 function to pass the UMT User data to the intended UMT User via the UMT User Adaptation entity based
22 on the subtype received in the `UMTPDU` by asserting the `UMTUSR.indication` primitive according the
23 procedures in 4.2.5.2.2.

24 **4.2.7 UMT Tunnel Multiplexer**

25 **4.2.7.1 Responsibilities of the UMT Tunnel Multiplexer**

26 The UMT Tunnel Multiplexer multiplexes requests from multiple UMT Tunnel Adapters and passes them
27 to the UMT Sublayer by asserting the `UMTPDU.request` primitive. Similarly, the UMT Tunnel Multiplexer
28 layer receives `UMTPDU`s from the UMT Sublayer via the `UMTPDU.indication` primitive and parses the
29 `UMTPDU`s for delivery to the UMT Tunnel Adapter designated by the SA and DA fields. Delivery to the
30 UMT Tunnel Adapter entity occurs via assertion of the `UMTTM.indication` primitive.

31 **4.2.7.2 Block Diagram**

32 Figure 4-4 depicts the major blocks within the UMT Tunnel Multiplexer and their interrelationships with
33 one another and external entities.

4.2.7.3 UMT Tunnel Multiplexer Interactions

The UMT Tunnel Multiplexer entity communicates with the UMT Sublayer using the following interlayer service interfaces:

UMTPDU.request

UMTPDU.indication

The UMTPDU.request and UMTPDU.indication service primitives described in this subclause are mandatory.

4.2.7.3.1 UMTPDU.request

4.2.7.3.1.1 Function

This primitive defines the transfer of data from an UMT Tunnel Multiplexer entity to the UMT Sublayer entity.

1 **4.2.7.3.1.2 Semantics of the service primitive**

2 The semantics of the primitive are as follows:

```
3 UMLTPDU.request (
4     destination_address,
5     source_address,
6     umt_type,
7     umt_subtype,
8     umt_user_sdu
9 )
```

10

11 The destination_address parameter may specify either an individual or a group MAC entity address and
 12 designates the intended UMT destination peer. The source_address parameter, if present, must specify an
 13 individual MAC address. If the source_address parameter is omitted, the local MAC sublayer entity will
 14 insert a value associated with that entity.

15 The umt_type corresponds directly to the Length/Type parameter that is defined by IEEE Std. 802.3. The
 16 umt_subtype and umt_user_sdu are copied from the UMLTTM.request primitive.

17 **4.2.7.3.1.3 When Generated**

18 This primitive is generated by the UMT Tunnel Multiplexer entity whenever an UMLTPDU is to be
 19 transferred to a peer entity.

20 **4.2.7.3.1.4 Effect of Receipt**

21 The receipt of this primitive will cause the UMT Sublayer entity to insert all UMLTPDU specific fields,
 22 including DA, SA, Length/Type and Subtype, and pass the properly formed UMLTPDU to the lower
 23 protocol layers for transfer to the peer UMT entity according to the procedures described in IEEE Std. 802.

24 **4.2.7.3.2 UMLTPDU.indication**

25 **4.2.7.3.2.1 Function**

26 This primitive defines the transfer of data from an UMT Sublayer entity to a UMT Tunnel Multiplexer
 27 entity.

28 **4.2.7.3.2.2 Semantics of the service primitive**

29 The semantics of the primitive are as follows:

```
30 UMLTPDU.indication (
31     destination_address,
32     source_address,
```

```

1         umt_type,
2         umt_subtype,
3         umt_user_sdu
4     )

```

5 The destination_address parameter is the MAC destination address of the incoming UMTPDU. The
6 source_address parameter is the MAC source address of the incoming UMTPDU. The umt_type parameter
7 contains the value of the Length/Type field from the received UMTPDU. The umt_subtype and
8 umt_user_sdu parameters are the Subtype and Data fields, respectively, from the incoming UMTPDU.

9 **4.2.7.3.2.3 When Generated**

10 This primitive is passed from the UMT Sublayer entity to the UMT Tunnel Multiplexer entity to indicate
11 the arrival of a UMTPDU to the local UMT Sublayer entity that is destined for a local UMT User. Such
12 UMTPDUs are reported only if they are validly formed and received without error.

13 **4.2.7.3.2.4 Effect of Receipt**

14 The receipt of this primitive by the UMT Tunnel Multiplexer will cause the UMT Multiplexer parser
15 function to pass the UMT User data to the intended UMT Tunnel Adapter by asserting the
16 UMTTM.indication primitive according to the procedures in 4.2.6.3.2.

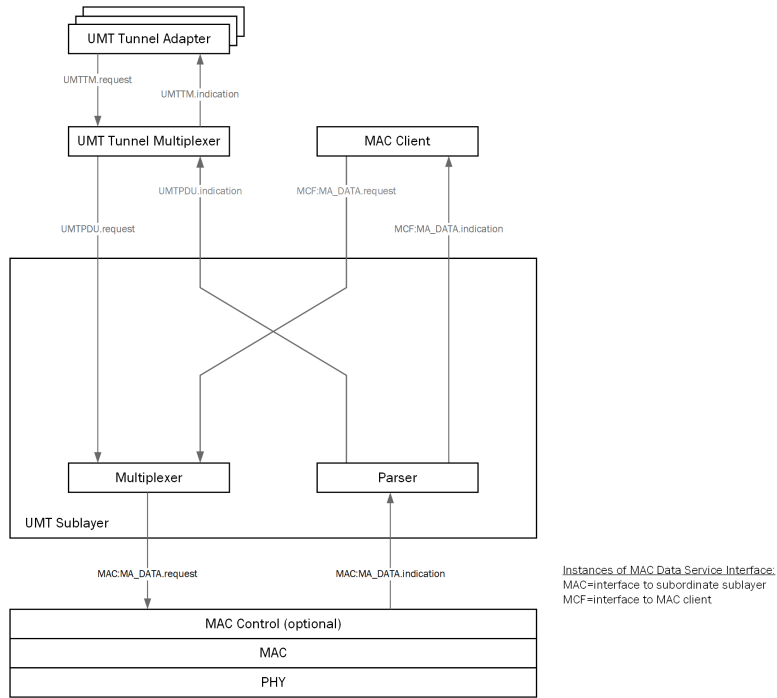

17 **4.2.8 UMT Sublayer**

18 **4.2.8.1 Responsibilities of the UMT Sublayer**

19 The UMT sublayer is the intermediate layer that multiplexes requests from the UMT Tunnel Control layer
20 with requests from the MAC Client. The UMT Sublayer passes these requests on to the MAC layer by
21 asserting the MAC:MA_DATA.request primitive. Similarly, the UMT Sublayer receives PDUs from the
22 MAC layer via the MAC:MA_DATA.indication primitive and parses the received PDUs for delivery to the
23 UMT Tunnel Control layer or MAC Client based on the Type/Length field. Delivery to the MAC Client
24 occurs via the MCF:MA_DATA.indication primitive. Delivery to the UMT Tunnel Control layer occurs via
25 the UMTPDU.indication primitive.

26 **4.2.8.2 Block Diagram**

27 Figure 4-5 depicts the major blocks within the UMT Sublayer and their interrelationships with one another
28 and external entities.

1

2

Figure 4-5 - UMT Sublayer Block Diagram

3 **4.2.8.3 UMT Sublayer Interactions**

4 The UMT Sublayer entity communicates with the MAC layer using the following interlayer service
 5 interfaces:

6 MAC:MA_DATA.request

7 MAC:MA_DATA.indication

8 The UMT Sublayer entity communicates with the MAC Client using the following interlayer service
 9 interfaces:

10 MCF:MA_DATA.request

11 MCF:MA_DATA.indication

12 Operation of the MA_DATA.request and MA_DATA.indication primitives is defined in IEEE Std. 802.3
 13 Clause 2. The following sections describe their operation in the context of UMT. Where there is any
 14 conflict between this standard and IEEE Std. 802.3 Clause 2, the latter takes precedence.

15 **4.2.8.3.1 MCF:MA_DATA.request**

16 **4.2.8.3.1.1.1 Function**

17 See IEEE Std. 802.3 Clause 2.3.1.1

18 **4.2.8.3.1.1.2 Semantics of the service primitive**

19 See IEEE Std. 802.3 Clause 2.3.1.2

1 **4.2.8.3.1.1.3 When generated**

2 See IEEE Std. 802.3 Clause 2.3.1.3

3 **4.2.8.3.1.1.4 Effect of receipt**

4 The receipt of this primitive by the UMT Sublayer will cause the UMT Sublayer to call the MAC sublayer
5 MAC:MA_DATA.request service primitive with its parameters identical to the MCF:MA_DATA.request
6 primitive.

7 **4.2.8.3.2 MCF:MA_DATA.indication**

8 **4.2.8.3.2.1.1 Function**

9 See IEEE Std. 802.3 Clause 2.3.2.1

10 **4.2.8.3.2.1.2 Semantics of the service primitive**

11 See IEEE Std. 802.3 Clause 2.3.2.2

12 **4.2.8.3.2.1.3 When generated**

13 This primitive is generated by the UMT Sublayer to indicate to the superior MAC client entity the arrival of
14 a non-UMT PDU. The MCF:MA_DATA.indication primitive is called with its parameters identical to the
15 MAC:MA_DATA.indication primitive.

16 **4.2.8.3.2.1.4 Effect of receipt**

17 See IEEE Std. 802.3 Clause 2.3.2.4

18 **4.2.8.3.3 MAC:MA_DATA.request**

19 **4.2.8.3.3.1.1 Function**

20 See IEEE Std. 802.3 Clause 2.3.1.1

21 **4.2.8.3.3.1.2 Semantics of the service primitive**

22 See IEEE Std. 802.3 Clause 2.3.1.2

23 **4.2.8.3.3.1.3 When generated**

24 This primitive is generated by the UMT Sublayer when the superior MAC client asserts the
25 MCF:MA_DATA.request primitive. The MAC:MA_DATA.request primitive is called with its parameters
26 identical to the MCF:MA_DATA.request primitive.

27 The MAC:MA_DATA.request primitive is also called when a UMTPDU.request primitive is received from
28 the UMT Tunnel Multiplexer layer. In this case, the UMT Sublayer copies the destination_address and
29 source_address into the destination_address and source_address field of the MAC:MA_DATA.request
30 primitive. Further, the UMT Sublayer assembles the mac_service_data_unit field by concatenating the
31 umt_type, umt_subtype, and umt_user_sdu parameters received in the UMTPDU.request primitive.

32 **4.2.8.3.3.1.4 Effect of receipt**

33 See IEEE Std. 802.3 Clause 2.3.1.4

1 **4.2.8.3.4 MAC:MA_DATA.indication**

2 **4.2.8.3.4.1.1 Function**

3 See IEEE Std. 802.3 Clause 2.3.2.1

4 **4.2.8.3.4.1.2 Semantics of the service primitive**

5 See IEEE Std. 802.3 Clause 2.3.2.2

6 **4.2.8.3.4.1.3 When generated**

7 See IEEE Std. 802.3 Clause 2.3.2.3

8 **4.2.8.3.4.1.4 Effect of receipt**

9 The receipt of this primitive by the UMT Sublayer will cause the UMT Sublayer to parse the incoming
10 frame. Based on the value of the Length/Type field, the UMT Sublayer will determine whether the frame is
11 destined for the UMT Tunnel Multiplexer or the MAC Client.

12 If the frame is destined for the MAC Client, the UMT Sublayer will generate an
13 MCF:MA_DATA.indication service primitive with its parameters identical to the
14 MAC:MA_DATA.indication primitive.

15 If the frame is destined for the UMT Tunnel Multiplexer, the UMT Sublayer parses the UMTPDU to find
16 the Type, Subtype, and Data fields. After parsing the UMTPDU, the UMT Sublayer asserts the
17 UMTPDU.indication primitive with the `umt_type` parameter copied from the Type field, the `umt_subtype`
18 parameter copied from the Subtype field, and the `umt_user_sdu` parameter copied from the Data field.

19 **4.3 Detailed functions and state diagrams**

20 **4.3.1 State Diagram Variables**

21 **4.3.1.1 Constants**

22 UMT_Subtype

23 **The value of the Subtype field for UMTPDUs (see**

24 Table 4-2).

25 UMT_Protocol_Type

26 The value of the UMT Protocol Length/Type field. (see Table 4-1).

27 NULL

28 The value used to indicate the empty set or the non-existence of an entity.

29 **4.3.1.2 Variables**

30 BEGIN

31 A variable that resets the functions within UMT.

- 1 Values: TRUE; when any of the component UMT sublayers is reset.
- 2 FALSE; When (re-)initialization has completed.
- 3 ind_DA
- 4 ind_SA
- 5 ind_mac_service_data_unit
- 6 ind_reception_status
- 7 The parameters of the MA_DATA.indication service primitive, as defined in IEEE Std. 802.3
- 8 Clause 2.
- 9 ind_uml_tid
- 10 The value of the uml_tunnel_id parameter passed to the UML Tunnel Adapter in the
- 11 UMTTM.indication primitive.
- 12 Value: Integer
- 13 ind_Length/Type
- 14 The value of the Length/Type field in a received MAC protocol frame (see Table 4-1) and is
- 15 passed to the UML Tunnel Multiplexer in the uml_type parameter of the UMLTPDU.indication
- 16 primitive.
- 17 Value: Integer
- 18 ind_uml_subtype
- 19 **The value of the Subtype field in a received UML protocol frame (see**
- 20 Table 4-2) and is passed to the UML Tunnel Multiplexer in the uml_subtype parameter of the
- 21 UMLTPDU.indication primitive.
- 22 Value: Integer
- 23 ind_uml_user_sdu
- 24 The value of the Data field in a received UML protocol frame and is passed to the UML Tunnel
- 25 Multiplexer in the uml_user_sdu parameter of the UMLTPDU.indication primitive.
- 26 req_DA
- 27 req_SA
- 28 req_mac_service_data_unit
- 29 req_reception_status
- 30 The parameters of the MA_DATA.request service primitive, as defined in IEEE Std. 802.3 Clause
- 31 2.
- 32 req_uml_tid

1 The value of the `umt_tunnel_id` parameter passed to the UMT Tunnel Multiplexer in the
2 UMTTM.request primitive.

3 Value: Integer

4 `req_omt_type`

5 The value of the `omt_type` parameter passed to the UMT Sublayer in the UMTTPDU.request
6 primitive.

7 Value: Integer

8 `req_omt_subtype`

9 The value of the `omt_subtype` parameter passed to the UMT Client in the UMTUSR.request
10 primitive.

11 Value: Integer

12 `req_omt_user_sdu`

13 The value of the `omt_user_sdu` parameter passed to the UMT Client in the UMTUSR.request
14 primitive.

15 **4.3.1.3 Messages**

16 MAC:MA_DATA.indication

17 MCF:MA_DATA.indication

18 The service primitives used to pass a received frame to a client with the specified parameters.

19 MAC:MA_DATA.request

20 MCF:MA_DATA.request

21 The service primitives used to transmit a frame with the specified parameters.

22 UMTPDU.indication

23 UMTUSR.indication

24 UMTTM.indication

25 UMTUAL.indication

26 The service primitives used to pass a received UMTTPDU to a client with the specified parameters.

27 UMTPDU.request

28 UMTUSR.request

29 UMTTM.request

30 UMTUAL.request

1 The service primitives used to transmit a UMLTPDU with the specified parameters.

2 UMTPDUIND

3 Alias for UMLTPDU.indication (ind_DA, ind_SA, ind_Length/Type, ind_uml_subtype,
4 ind_uml_user_sdu)

5 UMTPDUREQ

6 Alias for UMLTPDU.request(req_DA, req_SA, req_uml_type, req_uml_subtype,
7 req_uml_user_sdu)

8 UMTUSRIND

9 Alias for UMTUSR.indication (ind_DA, ind_SA, ind_uml_subtype, ind_uml_user_sdu)

10 UMTUSRREQ

11 Alias for UMTUSR.request(req_uml_subtype, req_uml_user_sdu)

12 UMTTMREQ

13 Alias for UMTTM.request(req_uml_tid, req_uml_subtype, req_uml_user_sdu)

14 UMTTMIND

15 Alias for UMTTM.indication(ind_uml_tid, ind_DA, ind_SA, ind_uml_subtype,
16 ind_uml_user_sdu)

17 MADR

18 Alias for MA_DATA.request(req_DA, req_SA, req_mac_service_data_unit,
19 frame_check_sequence)

20 MADI

21 Alias for MA_DATA.indication(ind_DA, ind_SA, ind_mac_service_data_unit,
22 ind_reception_status)

23 **4.3.1.4 Functions**

24 get_sa(req_uml_tid)

25 This function returns the desired source MAC address to be used on the tunnel indicated by
26 req_uml_tid. This function returns NULL if the source MAC address is to be inserted by the MAC
27 layer. The implementation of the get_sa() function is out of scope for this standard.

28 get_da(req_uml_tid)

29 This function returns the desired destination MAC address to be used on the tunnel indicated by
30 ind_uml_tid). It is assumed that it is not possible to call this function prior to the specified tunnel's
31 creation and therefore it must always return a valid value. The implementation of the get_da()
32 function is out of scope for this standard.

33 get_tid(ind_SA, ind_DA)

1 This function returns the unique identifier of the UMT Tunnel Adapter associated with the
 2 indicated source MAC address and indicated destination MAC address. This function returns
 3 NULL if there is no UMT Tunnel Adapter configured with the specified source MAC address and
 4 destination MAC. The implementation of the `get_tid()` function is out of scope for this standard.

5 `length(binary_data)`

6 This function returns the length, in bits, of the `binary_data` parameter.

7 **4.3.1.5 Counters**

8 No counters are defined.

9 **4.3.1.6 Timers**

10 No timers are defined.

11 **4.3.2 UMT User Adaptation**

12 Refer to the annex for informative and normative descriptions of UMT User Adaptations for specific UMT
 13 User protocols.

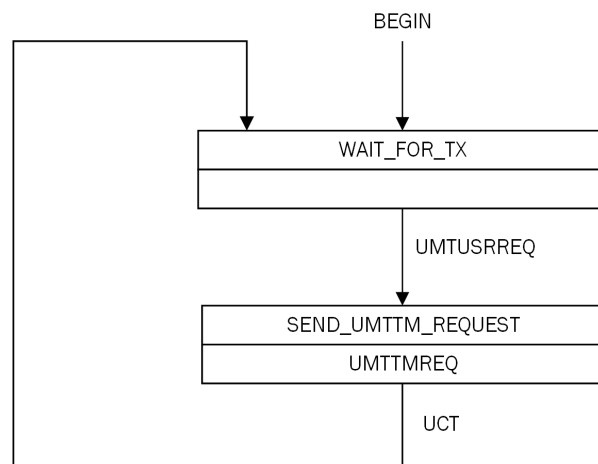

14 **4.3.3 UMT Tunnel Adapter**

15 As depicted in Figure 4-3, the UMT Tunnel Adapter is comprised of the functions:

- 16 a) **Multiplexer**. This function is responsible for multiplexing UMT user service data units received
 17 from the UMT User and UMT User Adaptation entities and passing them to the UMT Tunnel
 18 Multiplexer.
- 19 b) **Parser**. This function distinguishes among UMTPDU subtypes and passes received UMT user
 20 service data units to the appropriate UMT ser via the associated UMT User Adaptation entity.

21 **4.3.3.1 Multiplexer**

22 The UMT Tunnel Adapter shall implement the multiplexer state diagram shown in Figure 4-6.

23

24

Figure 4-6 - UMT Tunnel Adapter Multiplexer State Diagram

1 4.3.3.1.1 WAIT_FOR_TX State

2 Upon initialization, the WAIT_FOR_TX state is entered. While in the WAIT_FOR_TX state, the
3 Multiplexer waits for the occurrence of an UMTUSR.request. The UMTUSR.request signal can be asserted
4 by one or more UMT User Adaptation entities.

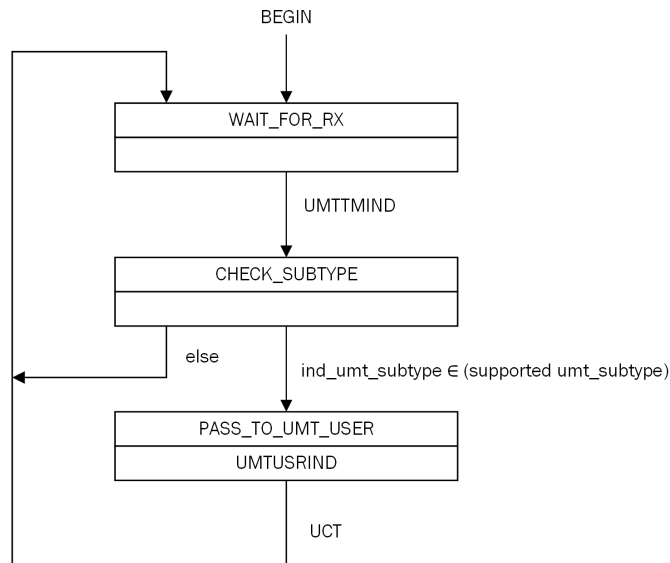

5 4.3.3.1.2 SEND_UMTTM_REQUEST State

6 **Once the Multiplexer reaches the SEND_UMTTM_REQUEST state, it shall**
7 **assert the UMTTM.request signal with the required parameters. The value of**
8 **req_omt_subtype shall be set by the UMT User Adaptation entity based on the**
9 **identity of the UMT User that asserted the UMTUAL.request. The value must be**
10 **taken from**

11 Table 4-2. The value of req_omt_tid shall be set by the UMT Tunnel Adapter based on the tunnel identifier
12 assigned to it at the time of its creation.

13 4.3.3.2 Parser

14 The UMT Tunnel Adapter shall implement the parser state diagram shown in Figure 4-7.

15

16

Figure 4-7 - UMT Tunnel Adapter Parser State Diagram

17 4.3.3.2.1 WAIT_FOR_RX State

18 Upon initialization, the WAIT_FOR_RX state is entered. While in the WAIT_FOR_RX state, the parser
19 waits for the occurrence of an UMTTM.indication. Upon assertion of UMTTM.indication the parser enters
20 the CHECK_SUBTYPE state.

21 4.3.3.2.2 CHECK_SUBTYPE State

22 In the CHECK_SUBTYPE state, the parser inspects the value of ind_omt_subtype. If the value of
23 ind_omt_subtype is an element of the supported UMT subtypes, the parser will transition to the
24 PASS_TO_UMT_USER state. If the value of ind_omt_subtype is not a supported UMT subtype, the parser
25 will discard the UMT PDU and move to the WAIT_FOR_RX state.

1 **A value of ind_umt_subtype is an element of the supported umt_subtypes if a**
 2 **UMT User Adaptation entity has registered itself to use the associated tunnel**
 3 **with one of the UMT Subtypes found in**

4 Table 4-2.

5 **4.3.3.2.3 PASS_TO_UMT_USER State**

6 In the PASS_TO_UMT_USER state, the parser asserts the UMTUSR.indication signal. The destination
 7 UMT User Adaptation entity is determined by the value of ind_umt_subtype.

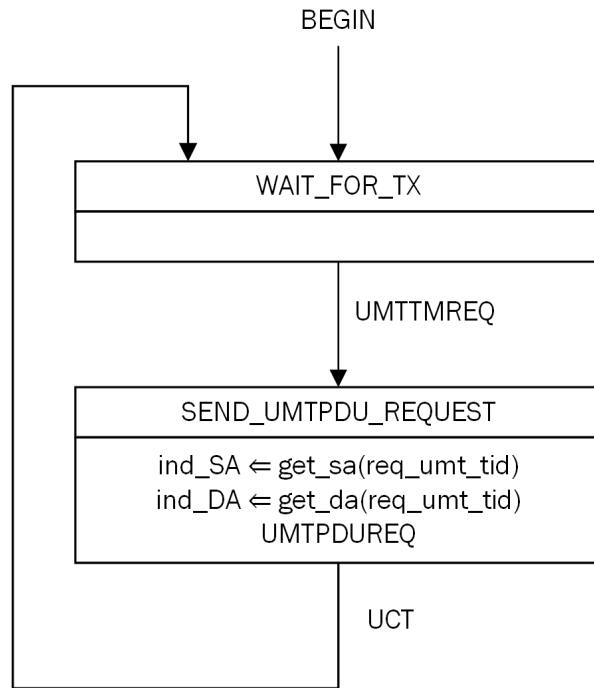

8 **4.3.4 UMT Tunnel Multiplexer**

9 As depicted in Figure 4-4, the UMT Tunnel Multiplexer is comprised of the following functions:

- 10 c) *Multiplexer*. This function is responsible for multiplexing UMT user service data units received
 11 from the UMT Tunnel Adapters and passing them to the UMT Sublayer.
- 12 d) *Parser*. This function distinguishes among UMT tunnels passes received UMT user service data
 13 units to the appropriate UMT Tunnel Adapter.

14 **4.3.4.1 Multiplexer**

15 The UMT Tunnel Multiplexer shall implement the multiplexer state diagram shown in Figure 4-8.

16

17 **Figure 4-8 - UMT Tunnel Multiplexer Multiplexer State Diagram**

18 **4.3.4.1.1 WAIT_FOR_TX State**

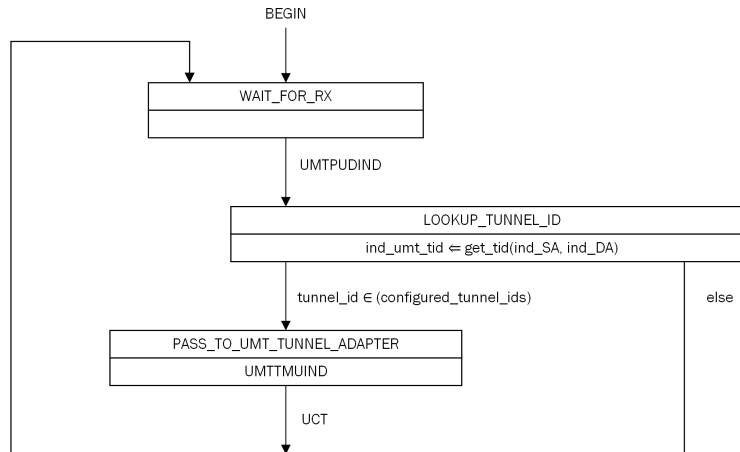

19 Upon initialization, the WAIT_FOR_TX state is entered. While in the WAIT_FOR_TX state, the
 20 Multiplexer waits for the occurrence of an UMTTM.request. The UMTTM.request signal can be asserted
 21 by one or more UMT Tunnel Adapter entities.

1 4.3.4.1.2 SEND_UMTPDU_REQUEST State

2 Once the Multiplexer reaches the SEND_UMTPDU_REQUEST state, it shall assert the UMTTPDU.request
3 signal with the required parameters. The value of req_SA req_DA are determined by calling the get_da()
4 and get_sa() functions. The value of req_omt_subtype and req_omt_user_sdu shall be copied from the
5 received UMTTM.request primitive parameters.

6 4.3.4.2 Parser

7 The UMT Tunnel Multiplexer shall implement the parser state diagram shown in Figure 4-9.

8

9

Figure 4-9 - UMT Tunnel Multiplexer Parser State Diagram

10 4.3.4.2.1 WAIT_FOR_RX State

11 Upon initialization, the WAIT_FOR_RX state is entered. While in the WAIT_FOR_RX state, the parser
12 waits for the occurrence of an UMTTPDU.indication. Upon assertion of UMTTPDU.indication the parser
13 enters the LOOKUP_TUNNEL_ID state.

14 4.3.4.2.2 LOOKUP_TUNNEL_ID State

15 In the LOOKUP_TUNNEL_ID state, the parser determines the local instance of UMT Tunnel Adapter
16 entity to which the UMTTPDU is destined by calling the get_tid() function. The parser will transition to the
17 PASS_TO_UMT_TUNNEL_ADAPTER state if the identified tunnel is an element of the configured
18 tunnels on the local UMT peer. If the identified tunnel is not configured on the local UMT peer, the parser
19 will discard the UMTTPDU and move to the WAIT_FOR_RX state.

20 A tunnel is an element of the configured tunnels if an administrator has configured the tunnel on the local
21 UMT peer. A tunnel may be configured by the administrator manually or through an automated UMT
22 peer discovery mechanism.

23 4.3.4.2.3 PASS_TO_UMT_TUNNEL_ADAPTER State

24 In the PASS_TO_UMT_TUNNEL_ADAPTER state, the parser asserts the UMTTM.indication primitive.
25 The destination UMT Tunnel Adapter entity is determined by the ind_omt_tid value returned in the
26 LOOKUP_TUNNEL_ID state.

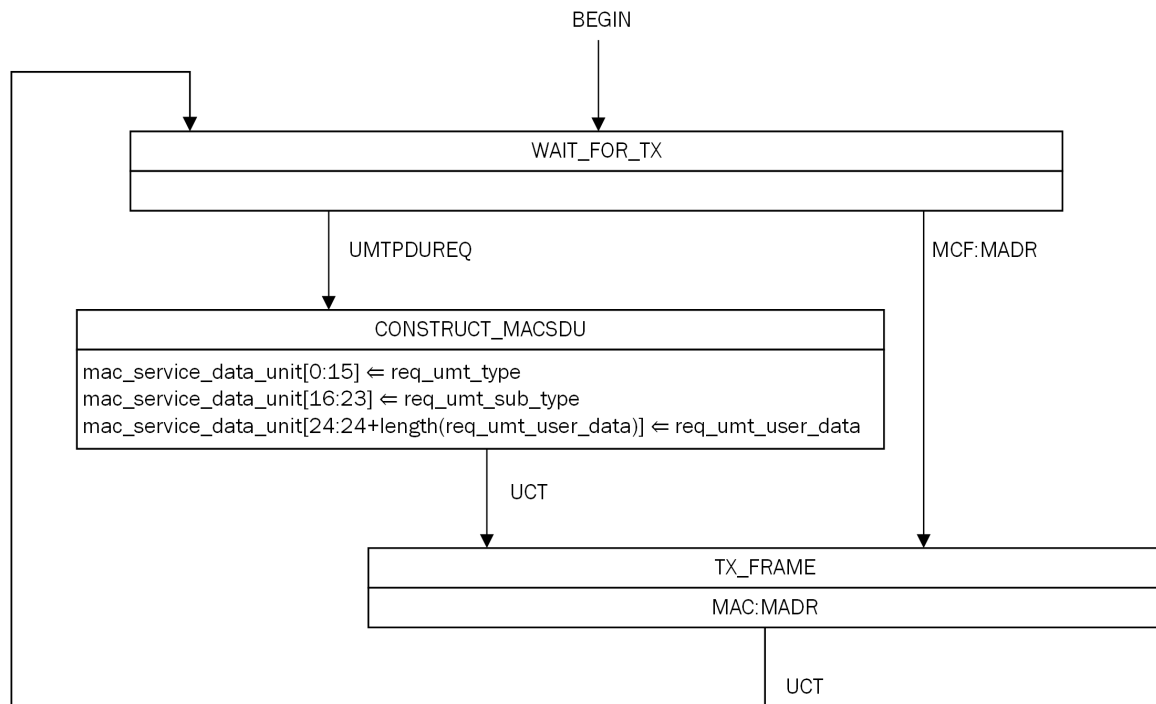

1 4.3.5 UMT Sublayer

2 As depicted in Figure 4-5, the UMT sublayer comprises the following functions:

- 3 e) **Multiplexer**. This function is responsible for passing frames received from the superior sublayer
 4 (i.e., UMT client) and UMTPDUs to the subordinate sublayer (e.g., MAC sublayer).
- 5 f) **Parser**. This function distinguishes among UMTPDUs and MAC client frames and passes each to
 6 the appropriate entity (UMT client or superior sublayer, respectively).

7 4.3.5.1 Multiplexer

8 The UMT Sublayer entity shall implement the multiplexer state diagram shown in Figure 4-10.

9

10 **Figure 4-10 - UMT Sublayer Multiplexer State Diagram**

11 4.3.5.1.1 WAIT_FOR_TX state

12 Upon initialization, the WAIT_FOR_TX state is entered. While in the WAIT_FOR_TX state, the
 13 Multiplexer waits for the occurrence of a UMTPDU.request or MCF:MA_DATA.request.

14 4.3.5.1.2 CONSTRUCT_MACSDU state

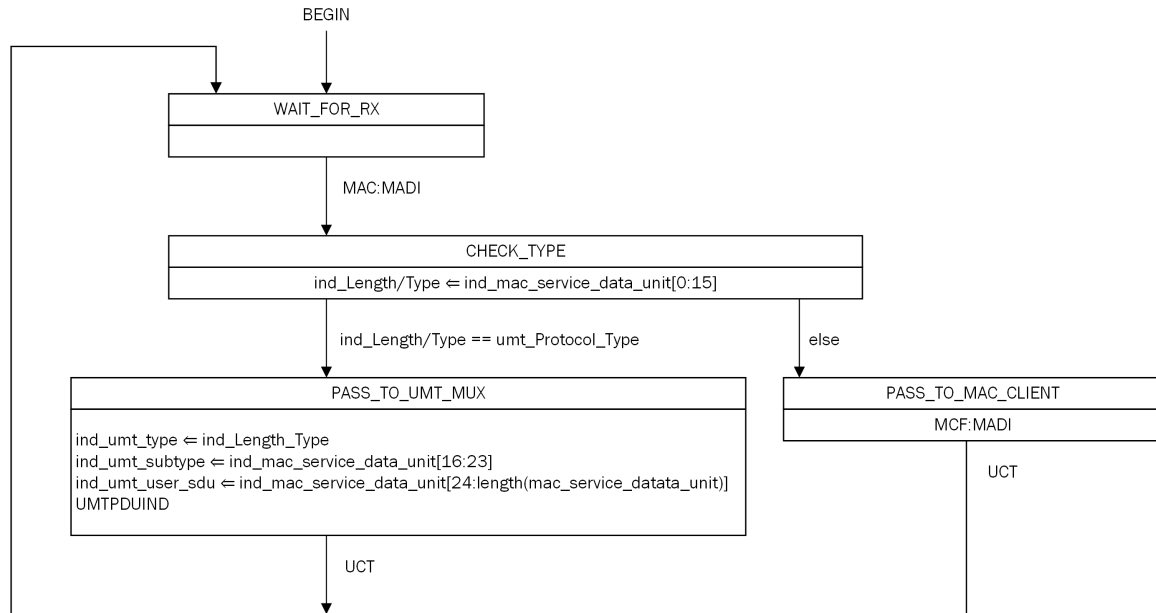

15 The multiplexer transitions to the CONSTRUCT_MACSDU state when a UMTPDU.request is received. In
 16 the CONSTRUCT_MACSDU state the multiplexer populates the Type/Length field with req_omt_type,
 17 the UMT subtype field with req_omt_sub_type, and the remainder of the MAC Data field with
 18 req_omt_user_sdu.

1 4.3.5.1.3 TX_FRAME state

2 Once the multiplexer reaches the TX_FRAME state, it shall provide transparent pass-through of frames
 3 submitted by the superior sublayer. The transmission of a UMT PDU shall not affect the transmission of a
 4 frame that has been submitted to the subordinate sublayer (i.e., the MAC's TransmitFrame function is
 5 synchronous, and is never interrupted). After the frame has been sent to the subordinate sublayer, the
 6 Multiplexer process returns to the WAIT_FOR_TX state.

7 4.3.5.2 Parser

8 The UMT Sublayer entity shall implement the parser state diagram shown in Figure 4-11.

9

10 **Figure 4-11 - UMT Sublayer Parser State Diagram**

11

11 4.3.5.2.1 WAIT_FOR_RX state

12

13 Upon initialization, the WAIT_FOR_RX state is entered. While in the WAIT_FOR_RX state, the parser
 14 waits for the occurrence of an MAC:MA_DATA.indication. Upon assertion of
 15 MAC:MA_DATA.indication the parser enters the CHECK_TYPE state.

15

15 4.3.5.2.2 CHECK_TYPE state

16

17 In the CHECK_TYPE state, the parser inspects the value of the ind_Length/Type field. If the value of the
 18 ind_Length/Type equals umt_Protocol_Type, the parser will transition to the PASS_TO_UMT_MUX state.
 19 If the value of the ind_Length/Type is anything else, the parser will move to the
 20 PASS_TO_MAC_CLIENT state.

20

20 4.3.5.2.3 PASS_TO_UMT_MUX

21

22 In the PASS_TO_UMT_MUX state, the parser parses the UMT PDU to find the ind_umt_subtype, and
 ind_umt_user_sdu and then asserts the UMT PDU.indication primitive.

1 **4.3.5.2.4 PASS_TO_MAC_CLIENT state**

2 In the PASS_TO_MAC_CLIENT state, the parser asserts the MCF:MA_DATA.indication primitive with
 3 parameters identical to those received from the MAC:MA_DATA.indication primitive.

4 **4.4 UMT PDU format**

5 **4.4.1 Ordering and representation of octets**

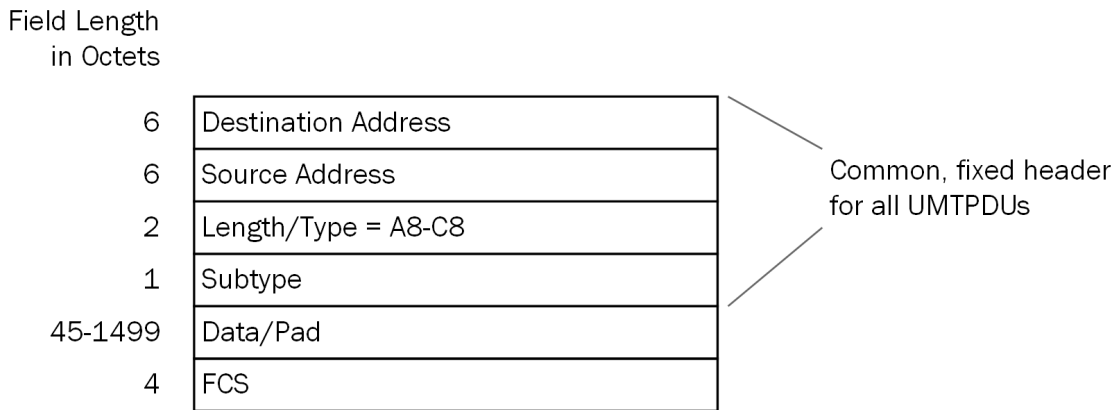

6 All UMLPDUs comprise an integral number of octets. When the encoding of (an element of) an UMLPDU
 7 is depicted in a diagram:

- 8 a) Octets are transmitted from top to bottom within the given field.
- 9 b) Within an octet, bits are shown with bit 0 to the left and bit 7 to the right.
- 10 c) When consecutive octets are used to represent a binary number, the octet transmitted first has the
 11 more significant value.
- 12 d) When consecutive octets are used to represent a MAC address, the least significant bit of the first
 13 octet is assigned the value of the first bit of the MAC address, the next most significant bit the
 14 value of the second bit of the MAC address, and so on for all the octets of the MAC address.

15 When the encoding of an element of an UMLPDU is depicted in a table, the least significant bit is bit 0.
 16 The bit/octet ordering of any Organizationally Unique Identifier (OUI) or Company ID (CID) field within
 17 an UMLPDU is identical to the bit/octet ordering of the OUI portion of the Destination Address
 18 (DA)/Source Address(SA). Additional detail defining the format of OUIs and CIDs can be found in IEEE
 19 Std 802-2014, 8.2.2.

20 **4.4.2 Structure**

21 The UMLPDU structure shall be as shown in Figure 4-12.

22 **Figure 4-12 - UMLPDU Frame Structure**

23 UMLPDUs shall have the following fields

- 24 a) **Destination Address (DA)**. The DA in the UMLPDU specifies the destination addressee(s) for
 25 which the frame is intended. Its use and encoding are specified in IEEE Std 802.3, Clause 4.
 26

- 1 b) **Source Address** (SA). The SA in UMTPDUs carries the individual MAC address associated with
 2 the port through which the UMTPDU is transmitted.
- 3 c) **Length/Type**. The Length/Type in UMTPDUs carries the UMT_Protocol_Type field value as
 4 specified in Table 4-1.
- 5 **Subtype**. The Subtype field identifies the specific UMT User layer being
 6 encapsulated. The Subtype field value is specified in
- 7 d) Table 4-2.
- 8 e) **Data**. This field contains the UMTPDU data. This field must be at least 45 octets in length to
 9 ensure that no UMTPDU is less than 64 octets in length.
- 10 f) **FCS**. This field is the Frame Check Sequence, as defined in IEEE Std. 802.3.

11
 12 **Table 4-1 - UMT_Protocol_Type Value**

Name	Value
UMT_Protocol_Type	A8-C8

13
 14 **Table 4-2 - UMT Subtype Values**

Protocol Subtype Value	Protocol Name
0	Reserved
1	Unassigned
2	Unassigned
3	IEEE Std. 802.3 and IEEE Std. 1904.1 Operations, Administration, and Maintenance (OAM)
4-10	Unassigned
11	IGMP
12	OMCI
13	UMT Relay
14-252	Unassigned
253	Vendor-Specific
254	UMT Peer Maintenance
255	Reserved

1 **4.4.3 UMT PDU Description**

2 The local UMT layer communicates with the remote UMT layer via UMT PDUs. UMT PDUs are identified
 3 with a specific code. UMT PDUs are formatted as compliant IEEE 802.3 frames, where the IEEE 802.3
 4 frame header format is described in IEEE Std. 802.3. UMT PDUs are further defined, as shown in Figure
 5 4-12, to include a Subtype field following the IEEE 802.3 defined Length/Type field. The Data field begins
 6 in a fixed location within the UMT PDU. The Data field contents are unique to the particular UMT PDU. All
 7 received UMT PDUs are parsed by the UMT layer to determine to which superior layer the Payload is to be
 8 delivered. The UMT Subtype field shall be used to determine which superior layer will receive the Payload.
 9 UMT PDUs with reserved Subtype field values are not transmitted. A UMT PDU containing a reserved
 10 Subtype value is ignored on receipt. A UMT PDU containing a Subtype value that is unsupported by the
 11 receiving UMT layer are ignored on receipt.

12 **4.4.4 UMT PDU Addressing**

13 A UMT tunnel is uniquely identified by the combination of the MAC Source Address and MAC
 14 Destination Address in the UMT PDU SA and DA fields. The SA shall be the MAC address of the local
 15 UMT peer and must not be a broadcast or group MAC address.

16 In typical operation the DA of the UMT PDU will be the unique MAC address of a UMT peer. This is
 17 referred to as unicast UMT operation.

18 Nothing in this standard disallows the use of a broadcast or group MAC address in the DA field of the
 19 UMT PDU. UMT broadcast mode operation refers to the case when a broadcast MAC address is used in the
 20 DA field of the UMT PDU. UMT multicast mode operation refers to the case when a group MAC address is
 21 used in the DA field of the UMT PDU.

22 When a UMT peer receives a UMT PDU with a broadcast or group MAC address in the DA field, the UMT
 23 sublayer shall pass the UMT PDU to the UMT Tunnel Multiplexer. The UMT Tunnel Multiplexer shall
 24 lookup the tunnel id as specified in 4.3.4.2. If no tunnel id is found to match the unique (SA,DA) pair, then
 25 the UMT Tunnel Multiplexer shall drop the UMT PDU, otherwise the UMT Multiplexer shall pass the
 26 UMT PDU to the corresponding UMT Tunnel Adapter. This implies that an administrator may configure a
 27 tunnel with a broadcast or group destination address, and must configure such a tunnel if broadcast or
 28 multicast UMT operation is desired.

29 **4.5 Protocol implementation conformance statement (PICS) proforma**

30 **4.5.1 Introduction**

31 The supplier of a protocol implementation that is claimed to conform to this standard shall complete the
 32 following protocol implementation conformance statement (PICS) proforma.

33 **4.5.2 Identification**

34 **4.5.2.1 Implementation identification**

Supplier	
Contact Point for inquiries about the PICS	
Implementation Name(s) and Version(s)	
Other information necessary for full identification— e.g., name(s) and version(s) for machines and/or	

operating systems; System Name(s)	
<p>NOTE 1—Only the first three items are required for all implementations; other information may be completed as appropriate in meeting the requirements for the identification.</p> <p>NOTE 2—The terms Name and Version should be interpreted appropriately to correspond with a supplier’s terminology (e.g., Type, Series, Model).</p>	

1

2 **4.5.2.2 Protocol Summary**

Identification of protocol standard	IEEE Std. 1904.2, Univeral Management Tunnel
Identification of amendments and corrigenda to this PICS proforma that have been completed as part of this PICS	
<p>Have any Exception items been required? No [] Yes []</p> <p>(The answer Yes means that the implementation does not conform to IEEE Std 1904.2.)</p>

4.6—UMT Architecture

A typical PON is deployed with an OLT at the local Central Office (CO) and several ONUs which are connected to the Outside Distribution Network (ODN) comprising at least one fiber splitter. The OLT acts as the management master responsible for controlling individual connected ONUs, including MPCP / OAM registration, service provisioning, etc., as defined in IEEE Std 1904.1-2013.

4.2.1. Single hop between Management Master and OLT

In this scenario, the UMT Management Master is collocated with the OLT within the CO, and it has access to all information within the OLT, such as status of individual ONUs, QoS profiles assigned to individual services, device status, etc.. Physically, the UMT Management Master in this architecture would have a form of a software agent running on the OLT hardware. This architecture example is shown in Figure 4-13.

Figure 4-13—Single hop between Management Master and OLT

4.2.2 Multiple hops between Management Master and OLT

In that example, the UMT Management Master does not have a direct access to the OLT, but it shares the same L2 network, providing access to information stored within the OLT via standardized interfaces. The UMT Management Master and the OLT are separated by a number of layer 2 hops. Physically, the UMT Management Master in this architecture would have the form of a software agent running on either a dedicated or virtual machine, physically separate from the OLT, but otherwise connected to the same LAN. The UMT Management Master in this case can be shared by more than one OLT, provided that all these OLTs are connected to the same LAN. This arrangement is shown in Figure 4-14.

Figure 4-14—Multiple hops between Management Master and OLT

4.2.3 Management Master sharing L3 network with EPON OLT

In that example, the UMT Management Master is connected (directly or indirectly) to the core transport network of the operator and manages a number of OLTs connected (directly or indirectly) to the same core transport network. The UMT Management Master is provided access to information stored within the OLT via standardized interfaces. Physically, the UMT Management Master in this architecture would have the form of a software agent running on either a dedicated or virtual machine, physically separate from the OLT, but otherwise reachable via IP level connectivity. The UMT Management Master in this case can be shared by more than one OLT, provided that all these OLTs are connected at the IP level. This arrangement is shown in Figure 4-15.
