## 1 13 Extended OAM for Nx25G-EPON

- 2 13.1 Introduction
- 3 13.2 Requirements

### 4 13.3 Device discovery and capability discovery

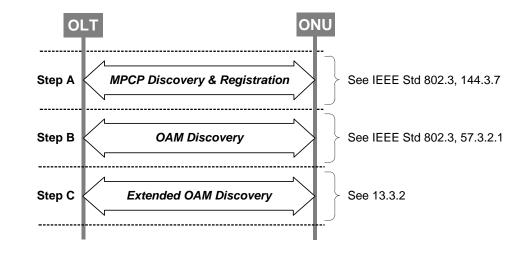

#### 5 13.3.1 MPCP/OAM discovery process

6 Figure 13-1 shows the relationship between the process of registration, initialization, and negotiation in

7 EPON prior to establishing the data plane connectivity. First, the MPCP discovery and registration process

8 is executed, as defined in IEEE Std 802.3ca, 144.3.7. Next, the process of OAM discovery, as defined in

9 IEEE Std 802.3, Clause 57, and eOAM discovery, as defined in the following subclauses, is executed.

10

11

### Figure 13-1—MPCP/OAM discovery process

### 12 13.3.2 eOAM discovery process

The eOAM discovery process in the EPON is used to <u>identify\_determine</u> whether the given connected ONU supports the specific subtype of the Organization Specific OAM extensions (as identified by the OUI\_and <u>major and minor versions</u>) and further to identify in order to verify the capabilities of such an ONU device in terms of the supported OAM functions.

The eOAM discovery process is executed once per ONU. The eOAM discovery process shall be executedon the primary MLID.

### 19 **13.3.2.1 Requirements**

20 <u>The ONU and OLT shall implement the eOAM discovery process by exchanging the Organization Specific</u>

21 Information TLV, as defined in IEEE Std 802.3, 57.5.2.3, and further specified in 13.4.4.1, henceforth

referred to as *Extended Information* TLV. The *Extended Information* TLV is embedded in the *Information* OAMPDU, as defined in IEEE Std 802.3, 57.4.3.1.

The OLT starts the eOAM discovery process immediately after the successful completion of the OAM
 discovery process, as specified in IEEE Std 802.3, 57.3.2.1.

- The EPON system shall implement the eOAM discovery process and the eOAM Capability Notification 1
- 2 mechanism, using the Organization Specific extensions to the Information TLV specified in

IEEE Std 802.3, 57.5.2.3. 3

4 The OLT shall disable all data services for the given ONU until the successful completion of the OAM discovery process (see IEEE Std 802.3, 57.3.2.1), and the eOAM discovery process, (see 13.3) and the 5 completion of the optional authentication process (see 11.2.2), if enabled by the operator. 6

7 The OLT shall deregister any ONU that does not failed to complete the eOAM discovery process, as 8 defined in 13.3, within five seconds of the time when the OLT sends the first Extended Information TLV to 9 this specific particular ONU. The OLT shall deregister any ONU that does not participate in the eOAM 10 discovery process, as defined in 13.3.

11 The ONU and OLT shall implement the eOAM discovery process by exchanging the Organization Specific

12 Information TLV, as defined in IEEE Std 802.3, 57.5.2.3, and further specified in 13.4.4.1, referred to as

Extended Information TLV. The Extended Information TLV is embedded in the Information OAMPDU, as 13

- 14 defined in IEEE Std 802.3, 57.4.3.1. The format of the Extended Information TLV is defined in 13.4.4.1. 15
- An ONU shall include the Extended Information TLV in all Information OAMPDUs exchanged during the eOAM discovery process. An ONU shall start the eOAM discovery process not later than five seconds after 16

17 the successful completion of the MPCP discovery and registration process.

18 The presence of the Extended Information TLV, indicating support for a specific version of the eOAM

19 management suite, embedded in the Information OAMPDU transmitted by the ONU during the eOAM

20 discovery process, indicates support of , Clause , and Clause . The lack of such an Extended Information

21 TLV is treated as a lack of support for the requirements set forth in , Clause , and Clause 14, and

22 consequently the OLT deregisters such an ONU as indicated above.

#### 23 13.3.2.2 Ordering of Organization Specific Information TLVs

#### 24 13.3.2.2.1 Source OAM Client requirements

25 A single IEEE Std 802.3, Clause 57, compliant Information OAMPDU may carry more than one 26 Organization Specific Information TLV. To simplify both the reception and transmission processes, a 27 specific order of transmission of such TLVs is required. In such a case, the Local Information TLV 28 (IEEE Std 802.3, 57.5.2.1) and Remote Information TLV (IEEE Std 802.3, 57.5.2.2) shall be transmitted 29 first, followed by the series of Organization Specific Information TLVs.

30 There are no specific transmission order requirements for Organization Specific Information TLVs. The

31 Extended Information TLV as defined in 13.4.4.1 may be transmitted as the first Organization Specific 32 Information TLV, followed by other Organization Specific Information TLVs, if present.

#### 33 13.3.2.2.2 Destination OAM Client requirements

34 The destination OAM Client shall support the processing of multiple Information TLVs in a single 35 Information OAMPDU, including Local Information TLV, Remote Information TLV, and at least one 36 Organization Specific Information TLV.

37 The destination OAM Client shall process all received Information TLVs in the order of their reception,

38 discarding any Information TLVs that are either malformed or unsupported. A malformed Information

39 TLV is considered to have an invalid length and/or unexpected type value. An unsupported Information

40 TLV follows the Information TLV format requirements, but is marked with an OUI not supported by the

41 given destination OAM Client.

#### 1 13.3.2.3 Message flow during eOAM discovery process

Figure 13-2 illustrates the message flow during the eOAM discovery process for compliant devices. The eOAM discovery process operates by exchanging the Extended Information TLV between the OLT and the ONU. The OLT and the ONU may send additional Organization Specific Information TLVs if they support other versions of management software identified by other OUI values. The eOAM discovery process comprises two steps described below:

#### 7 Step 1 — Discovery of OLT and ONU capabilities:

8 The OLT starts the eOAM discovery process immediately after the completion of the OAM 9 discovery process, by sending the *Information* OAMPDU (eOAM\_Discovery) with the 10 *Extended Information* TLV, as defined in 13.4.4.1. This message #1 contains the list of all 11 supported versions of the management software associated with the OUI value of the given 12 *Extended Information* TLV.

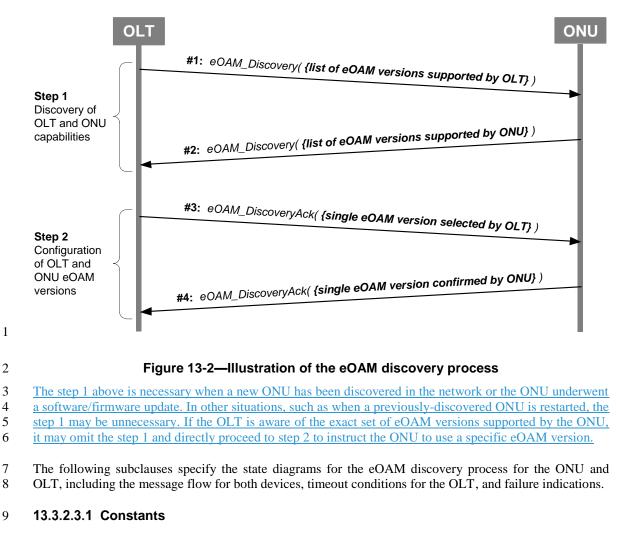

13The OLT may also send additional Organization Specific Information TLVs if it supports other14versions of management software identified by other OUI values. The order in which individual15Information TLVs are transmitted within the Information OAMPDU is defined in 13.3.2.2.

16 The ONU responds to the received eOAM\_Discovery message #1 by sending the 17 <u>eOAM\_Discovery message #2 with the Extended Information TLV containing the list of its</u> 18 supported versions of the management software associated with the <u>same</u>-OUI of the given 19 <u>Extended Information TLVin the cOAM\_Discovery message #2</u>. The ONU may also send 20 additional Organization Specific Information TLVs if it supports other versions of management 21 software identified by other OUI values.

#### 22 Step 2 - Configuration of OLT and ONU eOAM versions:

- 23Once the OLT receives the eOAM\_Discovery message #2 from the ONU with the list of24supported software versions, the OLT decides which version of the management software is to be25used. The OLT then notifies the ONU about the selected version using the26eOAM DiscoveryAck message #3, carrying the single eOAMversion value.
- The ONU confirms the selected extended OAM version by sending the eOAM\_DiscoveryAck message #4 with the same software version.

This concludes the eOAM discovery process, at which time both the ONU and the OLT know what software version to use for further communication across the management channel.

- 10 timeoutOLT
- 11 TYPE: 32 bit unsigned integertime interval
- 12 VALUE: 0x03 B9 AC A0 (1 second)

13This constant identifies the duration of the ONU response timeout period, during which the OLT14expects to receive response from the ONU as part of the extended OAM discovery process. If the15OLT fails to receive a response from the given ONU within this period of time, it retransmits the16previous Information OAMPDU carrying the Extended Information TLV. This constant is17expressed in units of time quanta.

- 18 **<u>13.3.2.3.2</u>** Variables
- 19 The variable type "eOAM version" is represented by a tuple {MajorVersion, MinorVersion} as
   20 defined in 13.4.4.1.
- 21 commonList

22

TYPE: Array of 8 bit unsigned integersSequence of eOAM versions

	1 2 3	This variable represents the list of extended OAM versions supported by both the OLT and the ONU. When there are no OAM versions supported by the OLT and the ONU simultaneously, this variable is an empty list. No particular ordering of OAM versions in the list is assumed.
1	4	confirmedVersion
	5	TYPE: 8 bit unsigned integereOAM version
	6	This variable represents the supported extended OAM version confirmed by the ONU.
	7	eOAMDiscoveryComplete
	8	TYPE: Boolean
	9 10 11	This variable indicates whether the extended OAM discovery process has been completed successfully (when set to true) or not (when set to false). It is set to the default value of false upon the discovery of the given C-ONUONU initialization.
	12	retryCount
	13	TYPE: 8-bit unsigned integer
	14	This variable represents the count of retransmission attempts performed by the OLT.
1	15	selectedVersion
	16	TYPE: 8 bit unsigned integereOAM version
	17 18	This variable represents the extended OAM version selected by the OLT from the list of versions supported by the ONU.
1	19	versionListOLT
	20	TYPE: Sequence of eOAM versionsArray of 8 bit unsigned integers
	21 22 23	This variable represents the list of extended OAM versions supported by the OLT. The value of this variable is assigned by the OLT manufacturer. No particular ordering of OAM versions in the list is assumed.
I	24	versionListONU
	25	TYPE: Sequence of eOAM versionsArray of 8 bit unsigned integers
	26 27 28 29	This variable represents the list of extended OAM versions supported by the ONU. In the ONU, the value of this variable is assigned by the manufacturer. In the OLT, the value of this variable is extracted from the received <i>Extended Information</i> TLV, as defined in 13.4.4.1. No particular ordering of OAM versions in the list is assumed.
	30	13.3.2.3.2 <u>13.3.2.3.3</u> Timers
	31	timerTimeout
	32	This timer measures the response timeout period, during which the OLT awaits the response from

33 the ONU with the specific *Extended Information* TLV.

# Table 13-5—Structure of the Extended Information TLV

[MajorVersion, MinorVersion], where the MajorVersion and the MinorVersion are 4-bit integers denoting the major and minor version of the extended OAM respectively. The MajorVersion value is mapped into the an 8 bit integer with 4 most-significant bits of eOAMversion[i] field, and the MinorVersion value is mapped into the representing the major version number and 4 least-significant bits representing the minor version number of the field. For example, an cOAMversion[i] field carrying the value of 0b0010.0000 represents a major version 2 and a minor version 0 (version 2.0). The versionList field of the compliant OLT and ONUs shall include the eOAMversion values as listed in Table 13-6 and may also include other values.
